Can we improve descriptions of nuclear effects in neutrino interactions using electron-scattering data?

Artur M. Ankowski
Center for Neutrino Physics, Virginia Tech

Fermilab Neutrino Seminar
May 11, 2017

Outline

1) **Introduction**
- Why do we need to model nuclear effects accurately?
- What can we learn from electron scattering?

2) **Spectral function approach**
- Short-range correlations
- Are final-state interactions relevant?

3) **Measurement of the spectral function of ^{40}Ar**
- Physics motivation
- Coincidence electron scattering and the spectral function

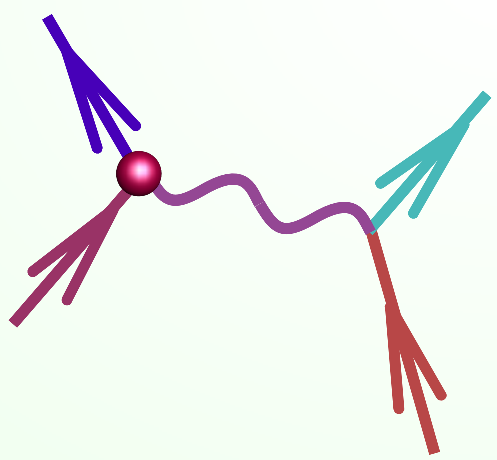
4) **Summary**

Energy reconstruction

Kinematic reconstruction

In quasielastic scattering off free nucleons, $\bar{\nu} + p \to l + n$ and $\nu + n \to l + p$, we can deduce the neutrino energy from the charged lepton's kinematics.

No need to reconstruct the nucleon kinematics.

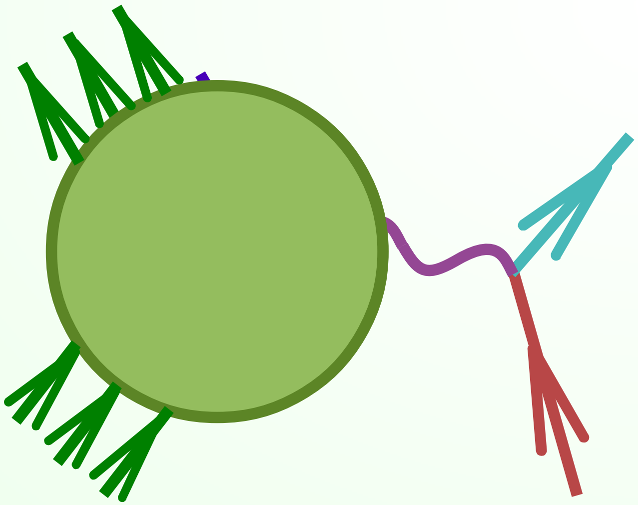


E' and θ known

$$E = \frac{ME' + \text{const}}{M - E' + |\boldsymbol{k}'|\cos\theta}$$

Kinematic reconstruction

In nuclei the reconstruction becomes an approximation due to the binding energy, Fermi motion, final-state interactions, two-body interactions etc.

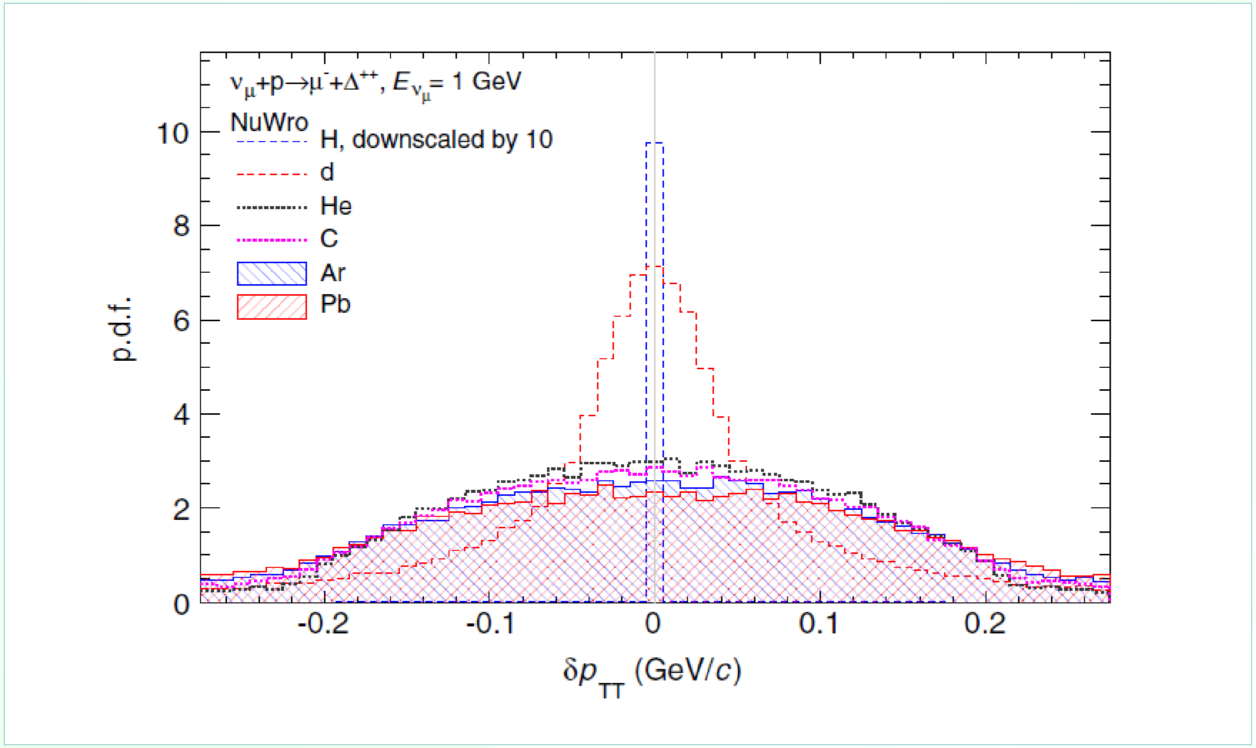


E' and θ known

$$E \simeq \frac{(M-\epsilon)E' + \text{const}}{M - \epsilon - E' + |\boldsymbol{k}'|\cos\theta}$$

Free-proton events

For targets containing H, the (ν and $\bar{\nu}$) pion-production events on free protons could be separated out, based on the balance of the transverse momentum.

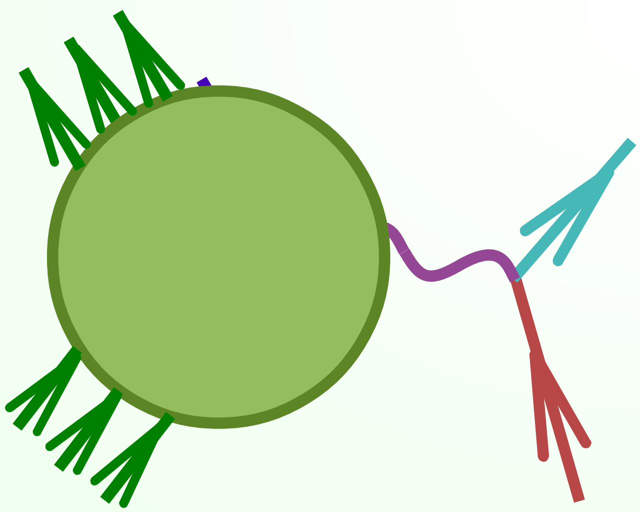


Lu *et al.*, PRD 92, 051302 (2015)

Unknown monochromatic beam

Consider the simplest (unrealistic) case:

the beam is monochromatic but its energy is unknown and has to be reconstructed

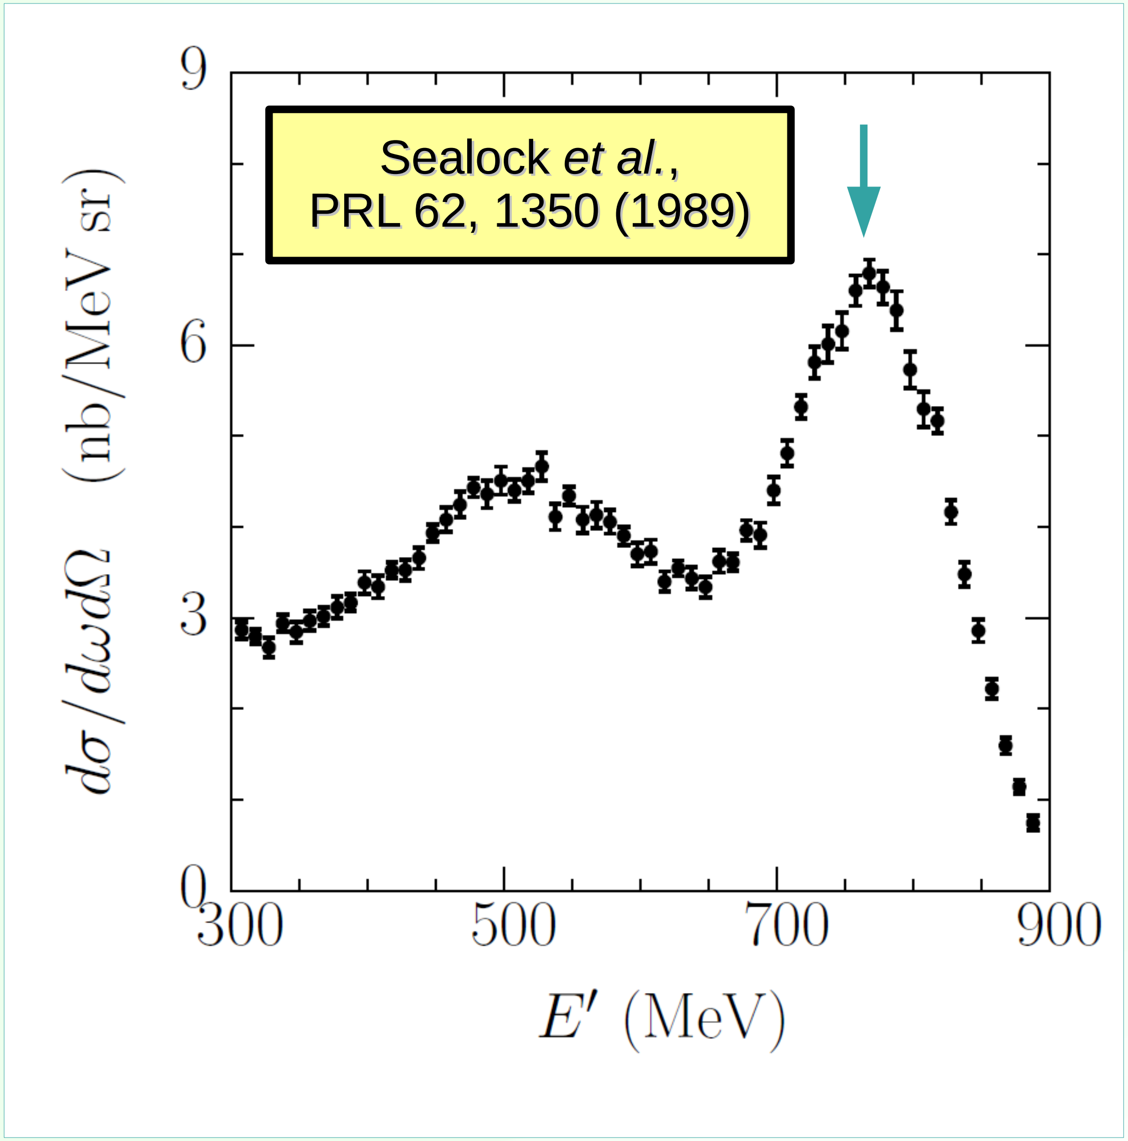


E' and θ known

$E = ?$

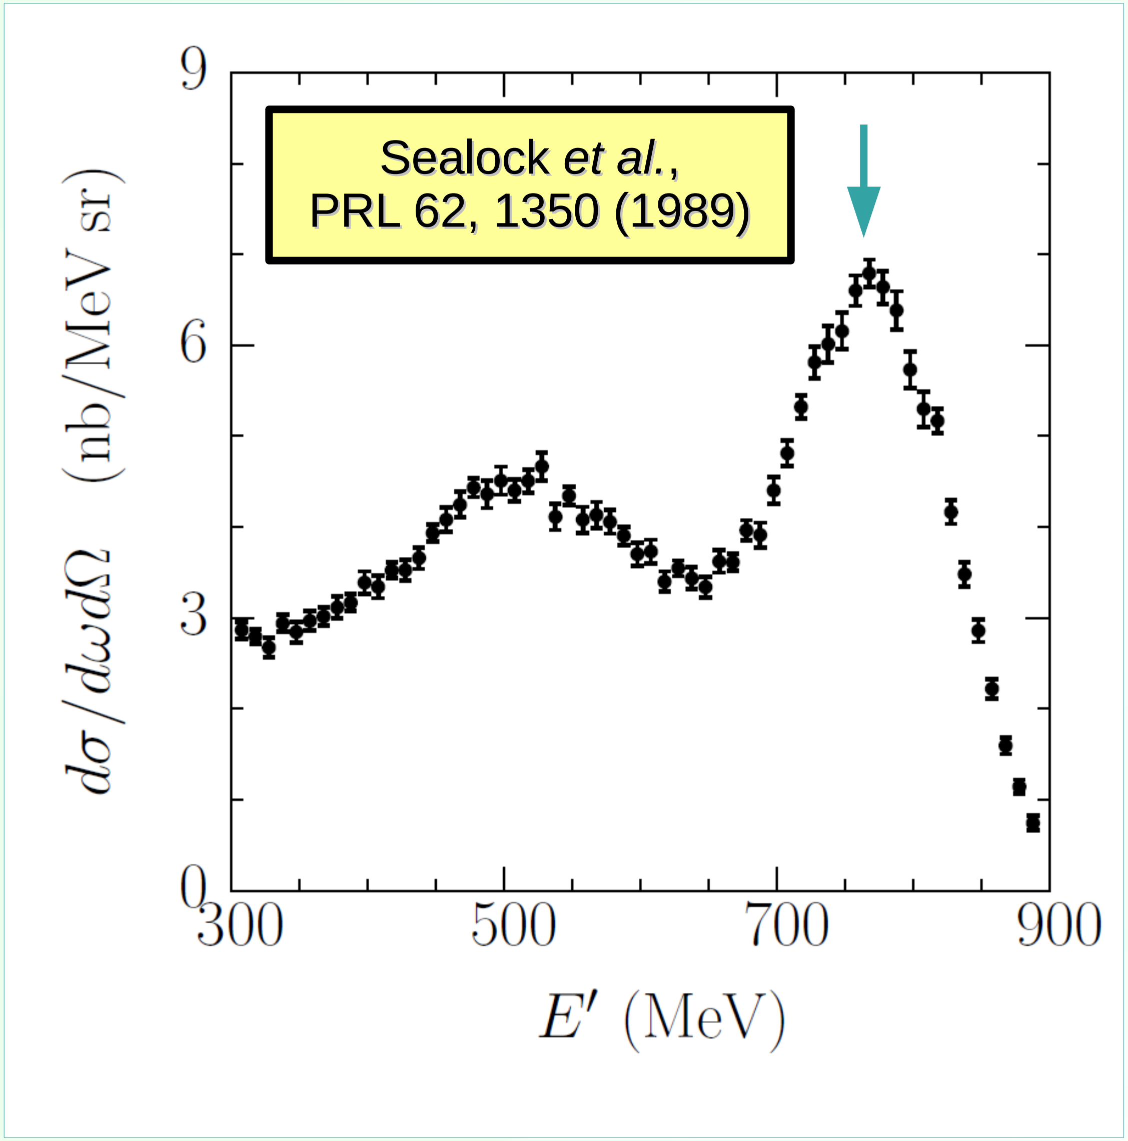
PoS(NuFact2014)004

“Unknown” monochromatic e^- beam



$E' = 768$ MeV
$\theta = 37.5$ deg
$\Delta E' = 5$ MeV

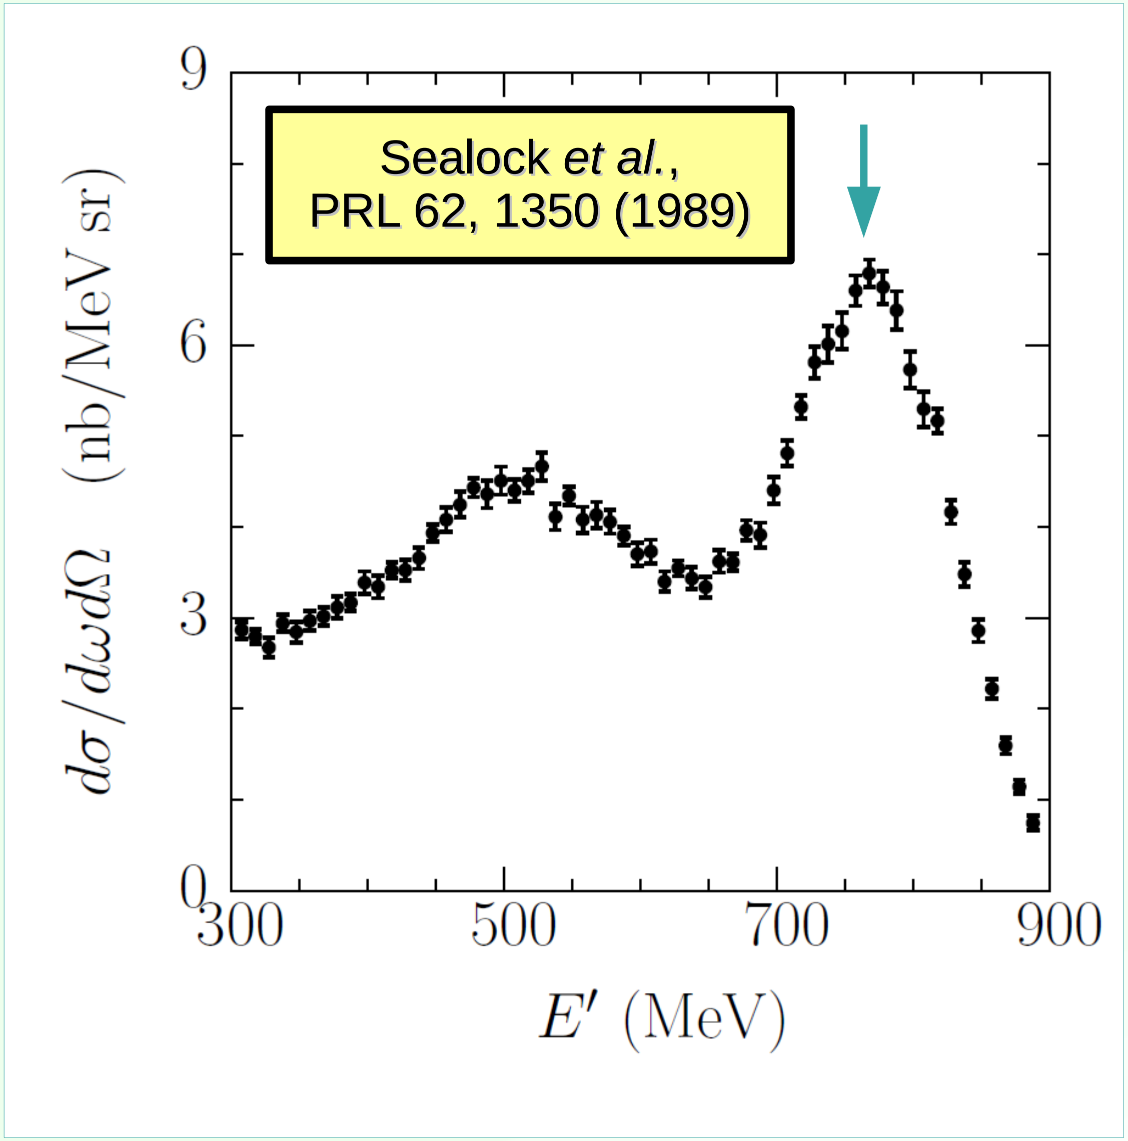
“Unknown” monochromatic e^- beam



$E' = 768$ MeV
$\theta = 37.5$ deg
$\Delta E' = 5$ MeV

for $\epsilon = 25$ MeV
$E = 960$ MeV
$\Delta E = 7$ MeV

"Unknown" monochromatic e^- beam



$E' = 768$ MeV
$\theta = 37.5$ deg
$\Delta E' = 5$ MeV

for $\epsilon = 25$ MeV
$E = 960$ MeV
$\Delta E = 7$ MeV

true value
$E = 961$ MeV

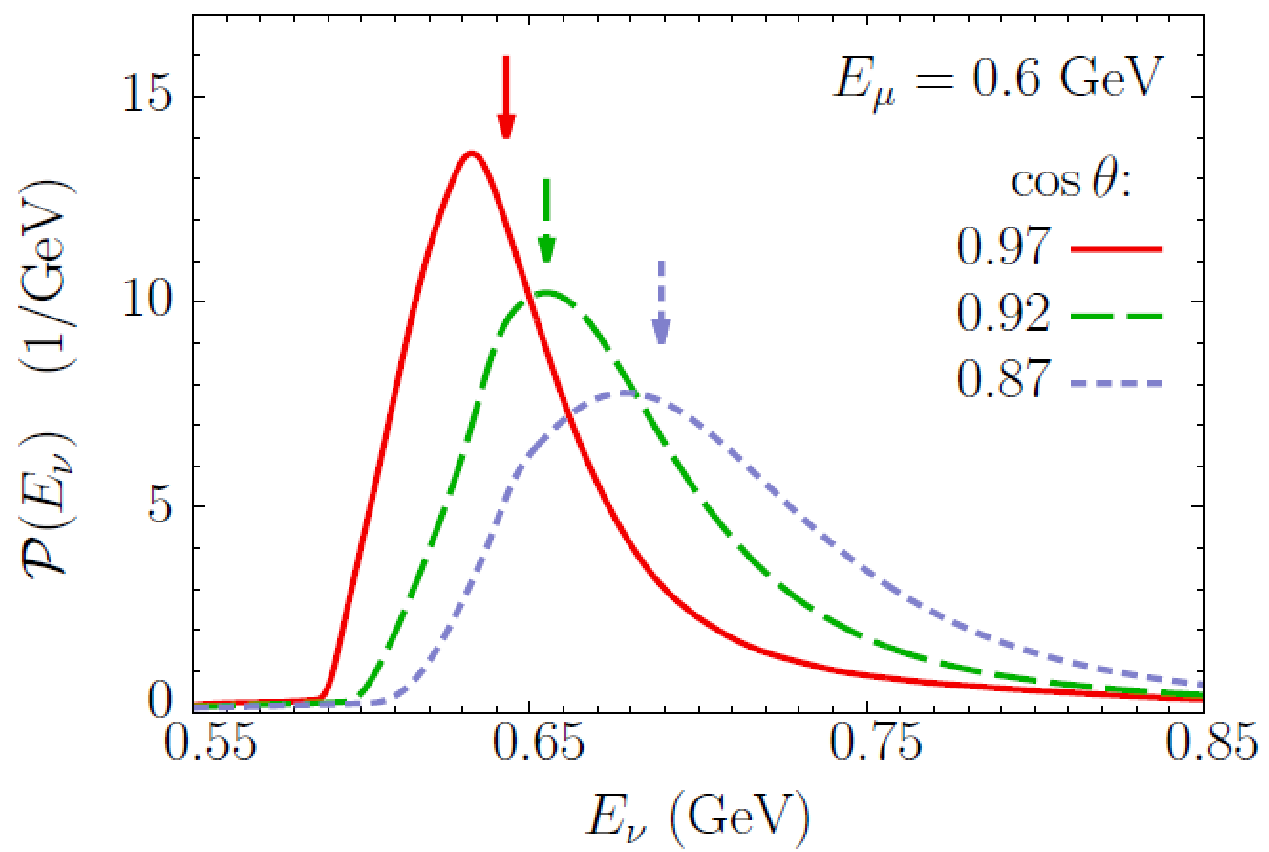
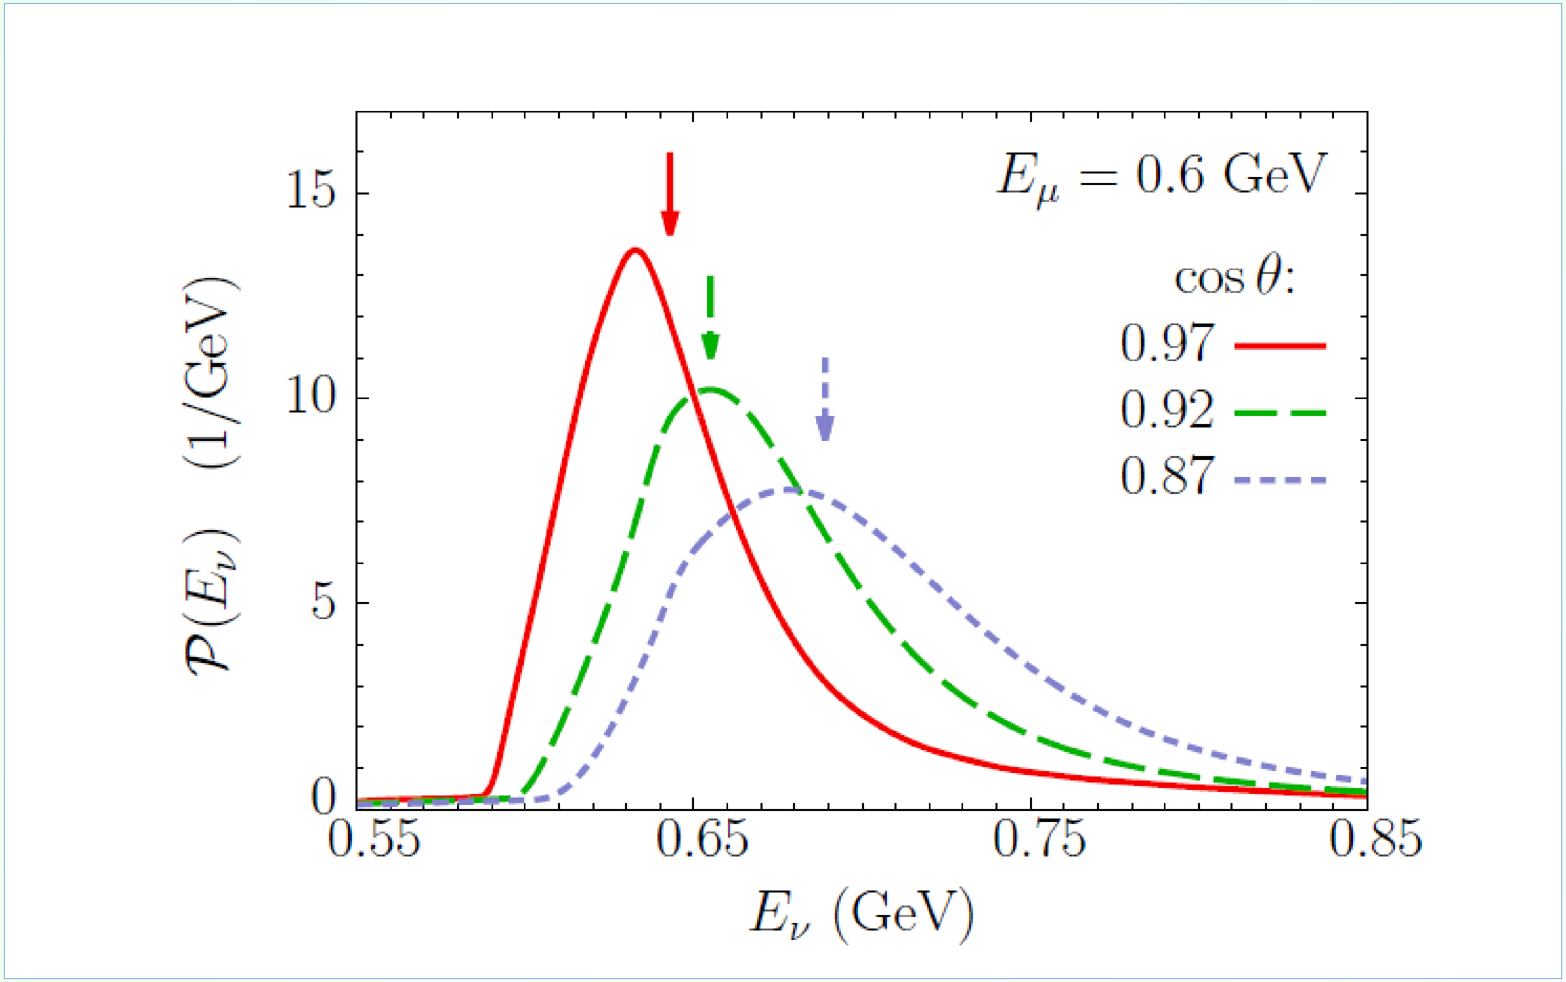
Realistic calculations vs E_{rec}



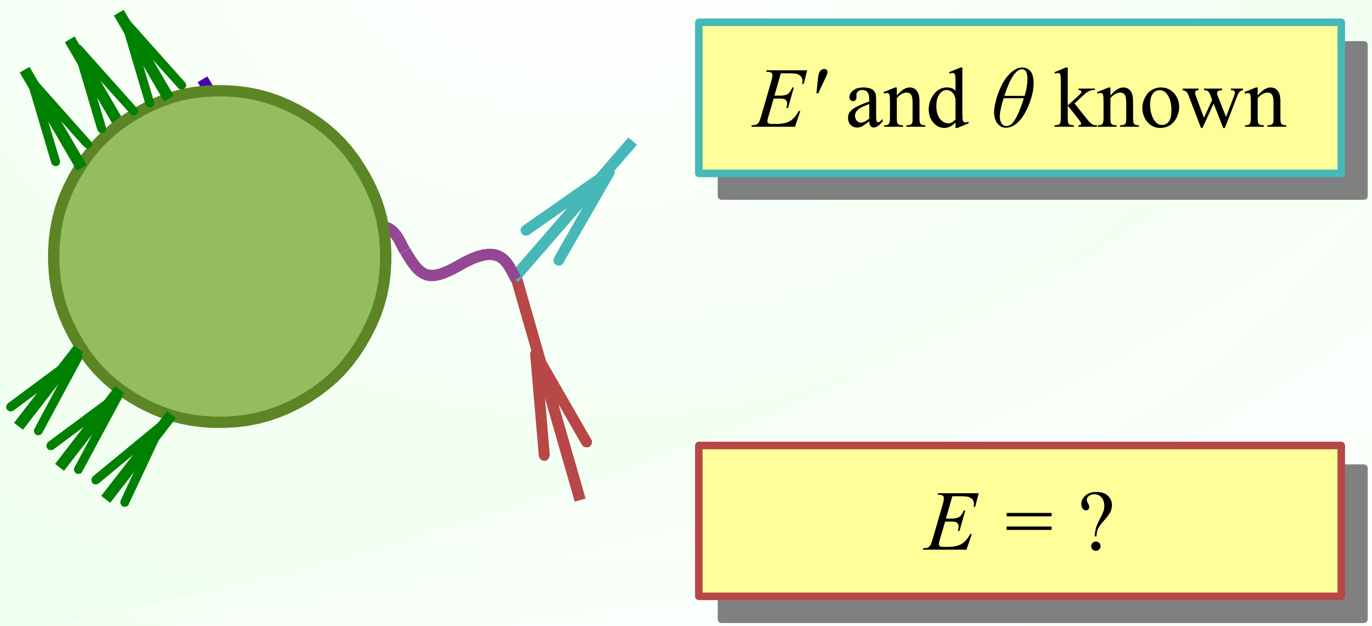
Realistic calculations vs $E_{\rm rec}$



Same physics drives the QE peak position and relates the kinematics to neutrino energy

Polychromatic beam

In modern experiments, the neutrino beams are not monochromatic, and the energy must be reconstructed from the observables, typically E' and $\cos\theta$ under the CCQE event hypothesis.



CCQE events

In practice, CCQE event candidates are defined as containing **no pions observed**.

CCQE (any number of nucleons)

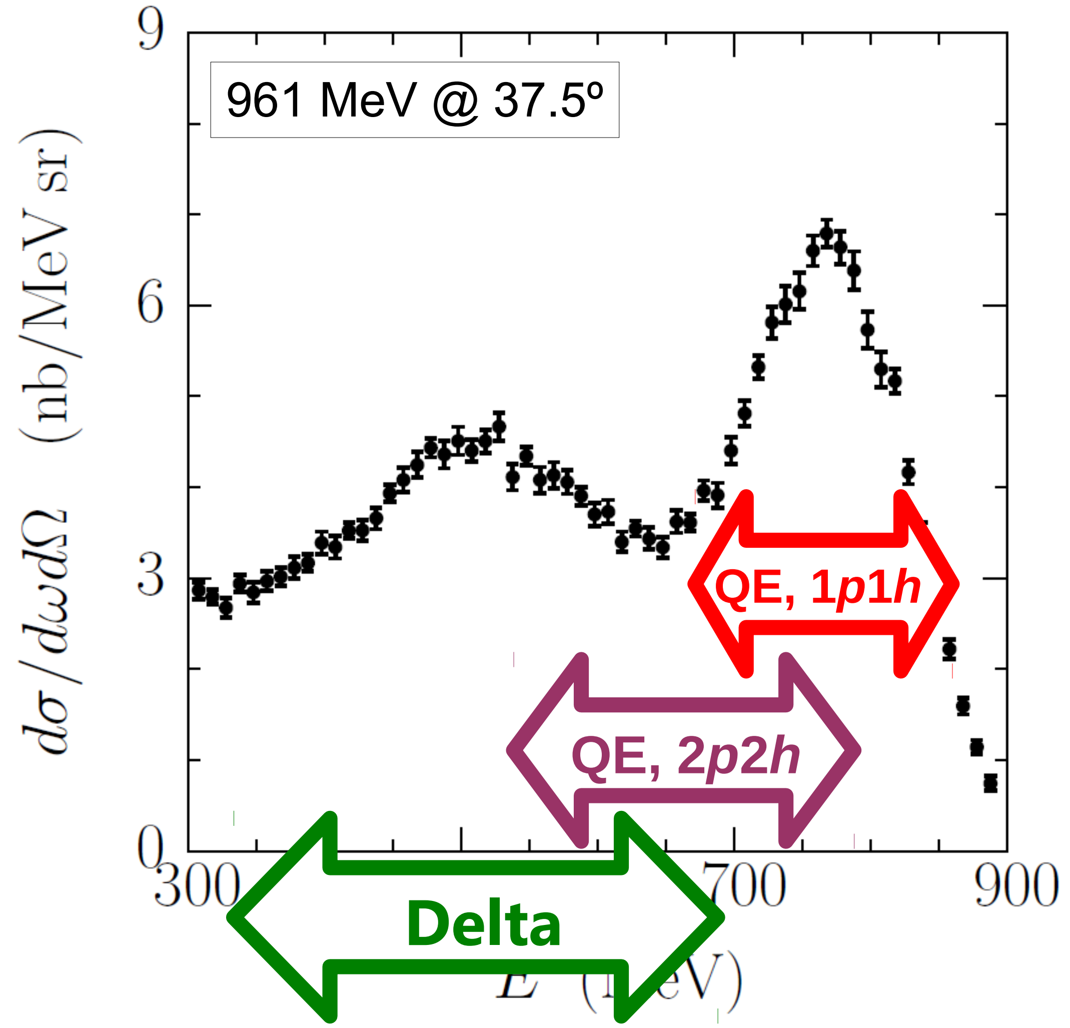
\+ pion production and followed by absorption

undetected pions

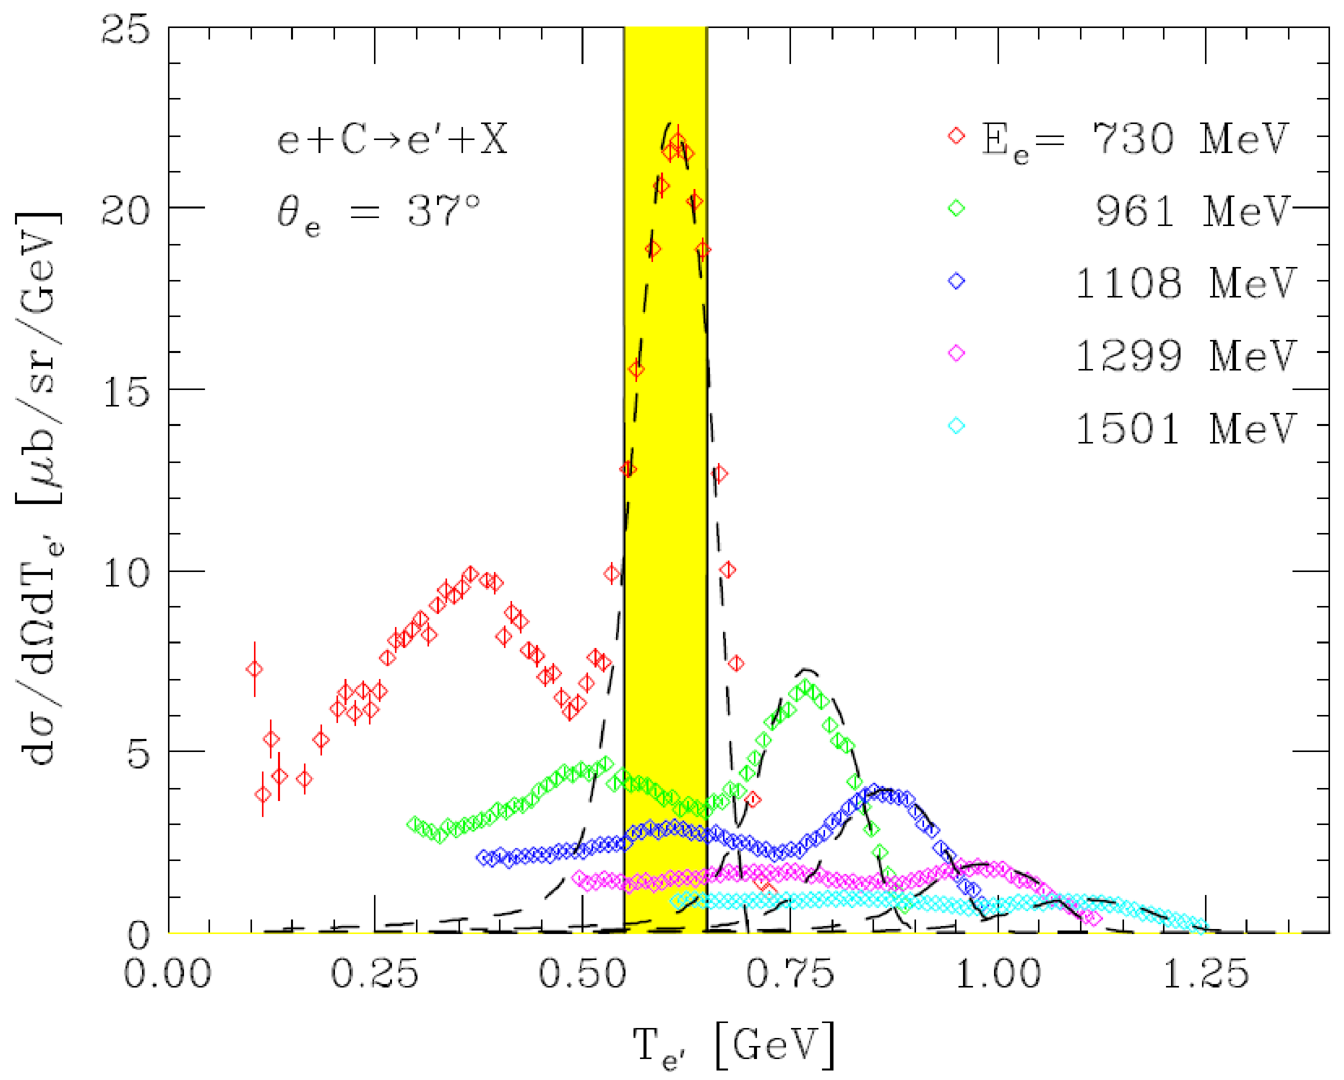
— CCQE with pions from FSI

0π events

Recall the monochromatic-beam case



CCQE events of given $l^{\pm}$ kinematics



Omar Benhar @ NuFact11, PRL 105, 132301 (2010)

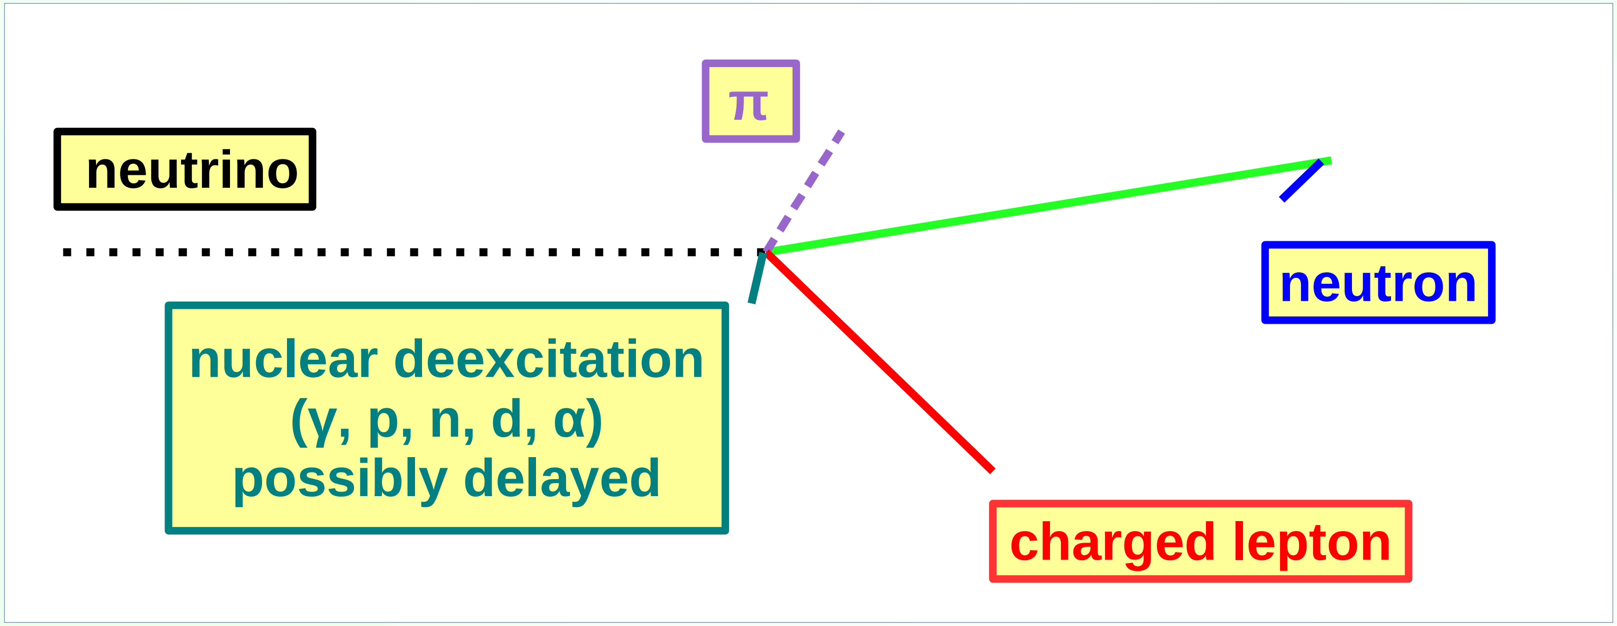
Calorimetric energy reconstruction

- Advantage: applicable to any final states
- Insensitive to nuclear effects when

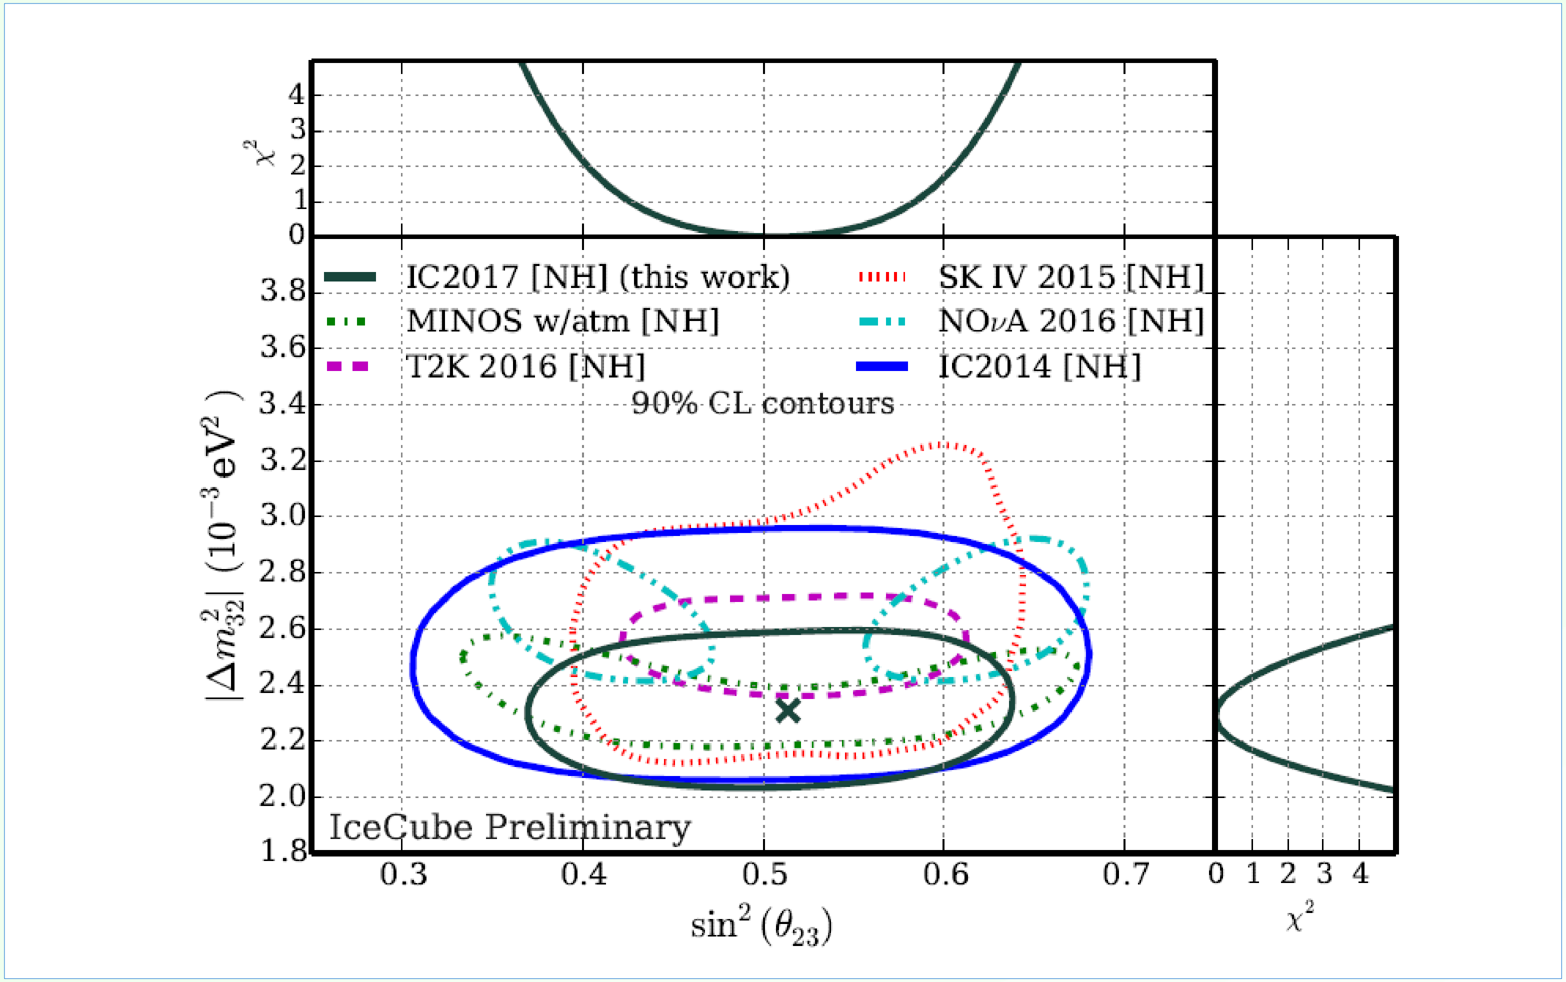
  missing energy « neutrino energy

- Otherwise, requires input from nuclear models

A.M.A., arXiv: 1704.07835



What precision are we reaching?



J. Hignight (IceCube), APS April Meeting, 2017

What precision are we reaching?

At the T2K kinematics (~600 MeV),

- 10% uncertainty (current T2K), ~60 MeV
- 2% uncertainty (current global fits), ~10 MeV

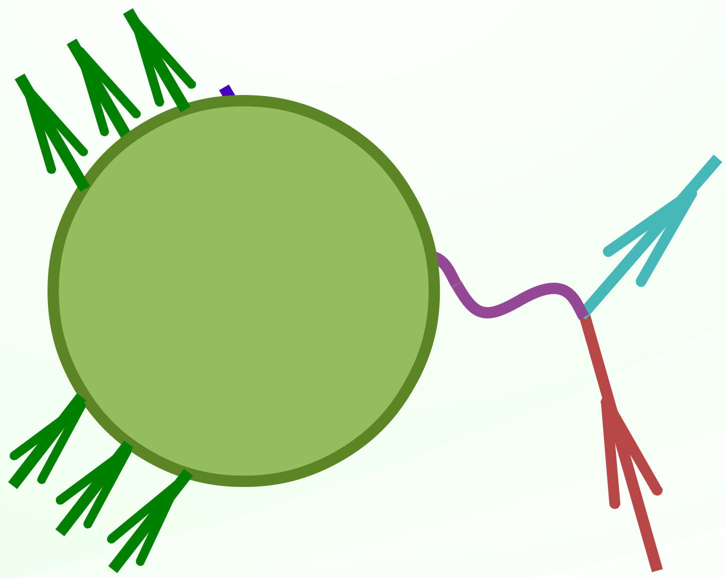
At the NOvA and DUNE kinematics, values x4−5.

Effects considered to be “small” need to be accounted for accurately to avoid biases.

Impulse approximation

Impulse approximation

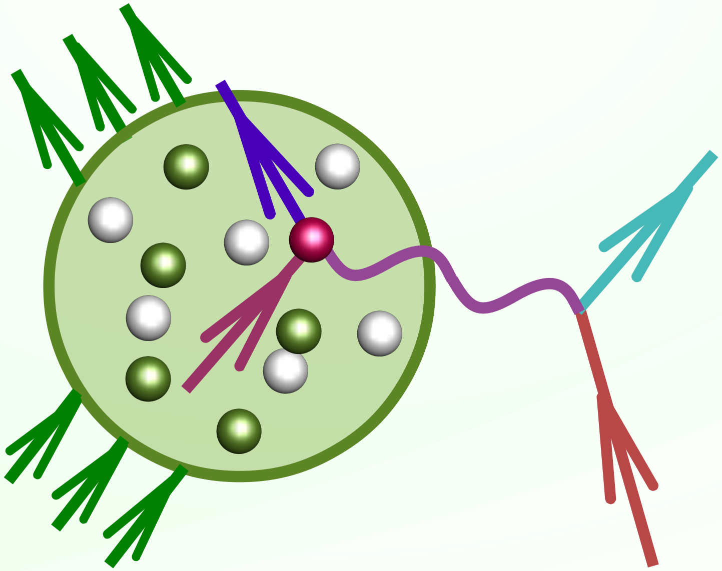
Assumption: the dominant process of lepton-nucleus interaction is **scattering off a single nucleon**, with the remaining nucleons acting as a spectator system.



Impulse approximation

Assumption: the dominant process of lepton-nucleus interaction is **scattering off a single nucleon**, with the remaining nucleons acting as a spectator system.

It is valid when the momentum transfer |**q**| is high enough, as the probe's spatial resolution is ~1/|**q**|.



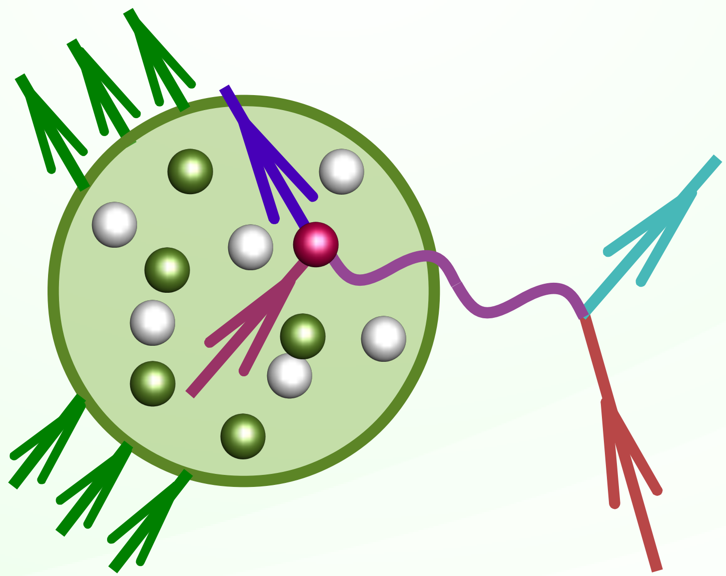
Impulse approximation

$$\frac{d\sigma^{\mathrm{IA}}_{\ell A}}{d\omega d\Omega} = \sum_N \int d^3p\, dE\, \underline{P^N_{\mathrm{hole}}(\mathbf{p}, E)}\, \underline{\frac{M}{E_{\mathbf{p}}} \frac{d\sigma^{\mathrm{elem}}_{\ell N}}{d\omega d\Omega}}\, \underline{P^N_{\mathrm{part}}(\mathbf{p}', \mathcal{T}')}$$

Spectral function

Elementary cross section

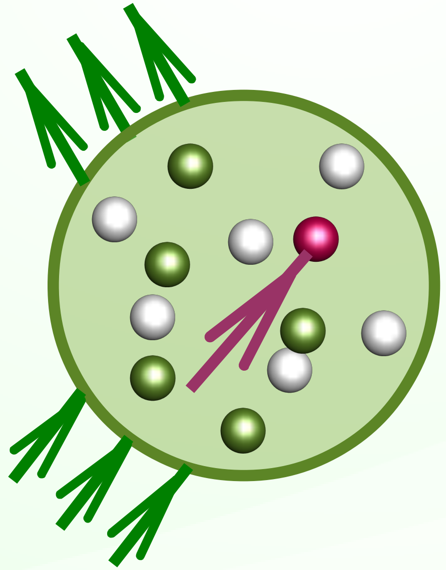
~δ(...) x Pauli blocking



Impulse approximation

$$\boxed{\frac{d\sigma^{\mathrm{IA}}_{\ell A}}{d\omega d\Omega} = \sum_N \int d^3p\, dE\, P^N_{\mathrm{hole}}(\mathbf{p}, E)\, \frac{M}{E_{\mathbf{p}}} \frac{d\sigma^{\mathrm{elem}}_{\ell N}}{d\omega d\Omega}\, P^N_{\mathrm{part}}(\mathbf{p}', \mathcal{T}')}$$

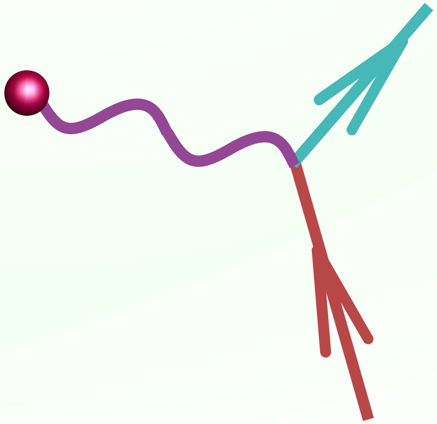
The (hole) spectral function describes the ground-state properties of the target nucleus.



Impulse approximation

$$\frac{d\sigma^{\rm IA}_{\ell A}}{d\omega d\Omega} = \sum_N \int d^3p\, dE\; P^N_{\rm hole}(\mathbf{p}, E)\; \underline{\frac{M}{E_{\mathbf{p}}}\frac{d\sigma^{\rm elem}_{\ell N}}{d\omega d\Omega}}\; P^N_{\rm part}(\mathbf{p}', \mathcal{T}')$$

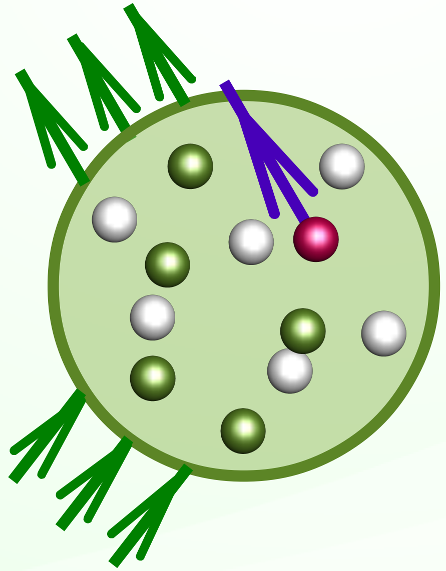
The elementary cross section characterizes the vertex



Impulse approximation

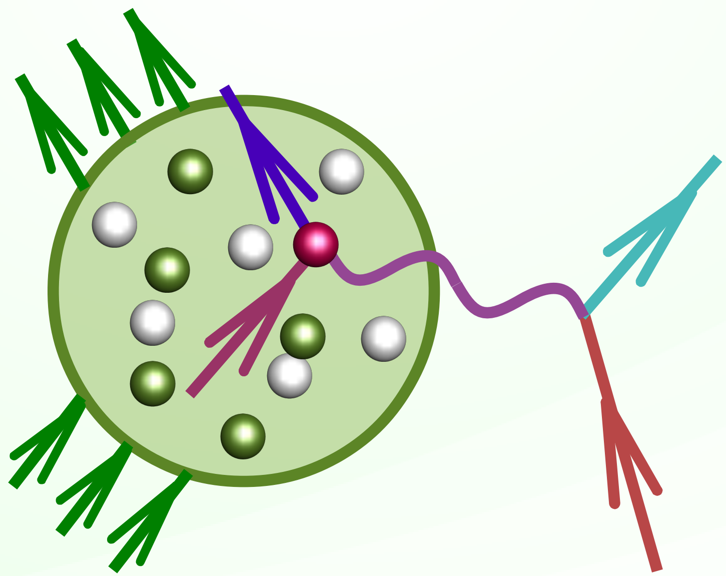
$$\frac{d\sigma^{\text{IA}}_{\ell A}}{d\omega d\Omega} = \sum_N \int d^3p\, dE\, P^N_{\text{hole}}(\mathbf{p}, E)\, \frac{M}{E_{\mathbf{p}}} \frac{d\sigma^{\text{elem}}_{\ell N}}{d\omega d\Omega}\, \underline{P^N_{\text{part}}(\mathbf{p}', \mathcal{T}')}$$

Ensures the energy conservation and Pauli blocking



Impulse approximation

$$\frac{d\sigma^{\mathrm{IA}}_{\ell A}}{d\omega d\Omega} = \sum_N \int d^3p\, dE\, \underbrace{P^N_{\mathrm{hole}}(\mathbf{p}, E)}_{\text{Spectral function}}\, \underbrace{\frac{M}{E_{\mathbf{p}}} \frac{d\sigma^{\mathrm{elem}}_{\ell N}}{d\omega d\Omega}}_{\text{Elementary cross section}}\, \underbrace{P^N_{\mathrm{part}}(\mathbf{p}', \mathcal{T}')}_{\sim\delta(\dots)\ \times\ \text{Pauli blocking}}$$



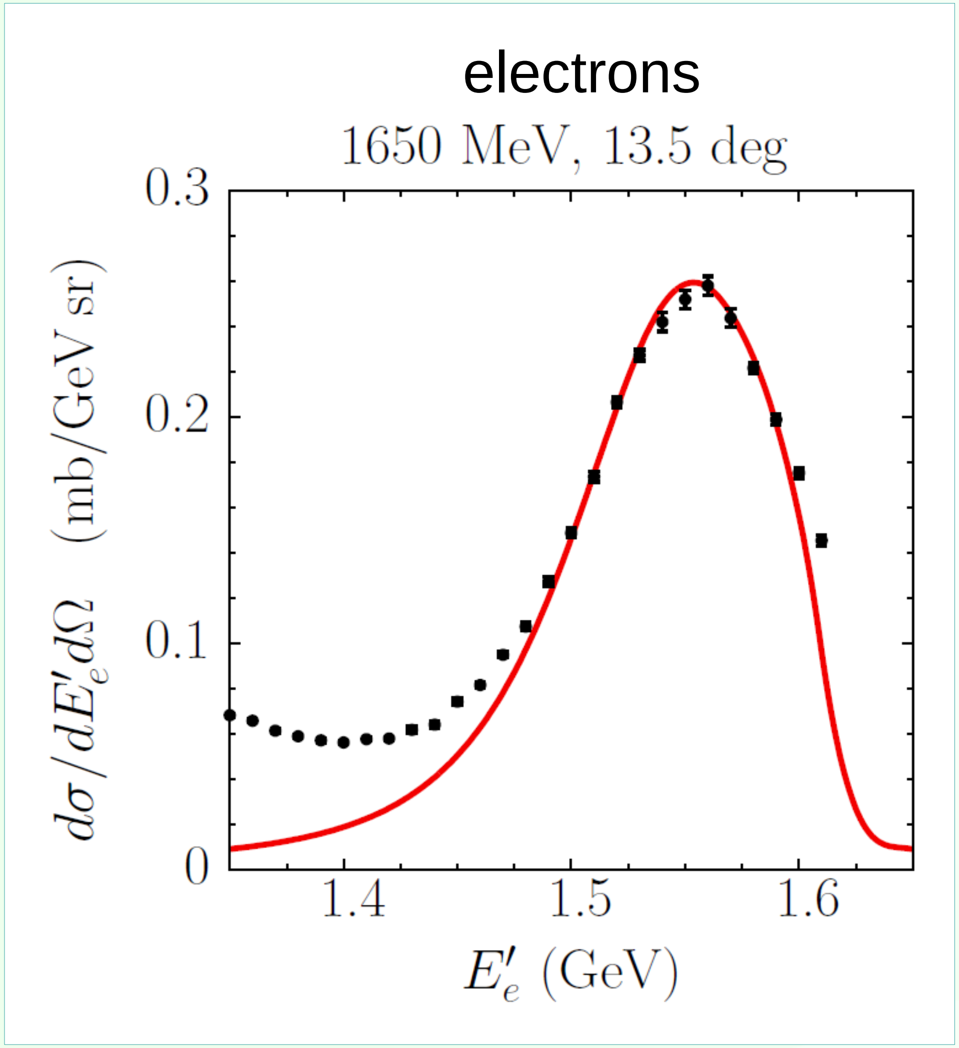
Impulse approximation

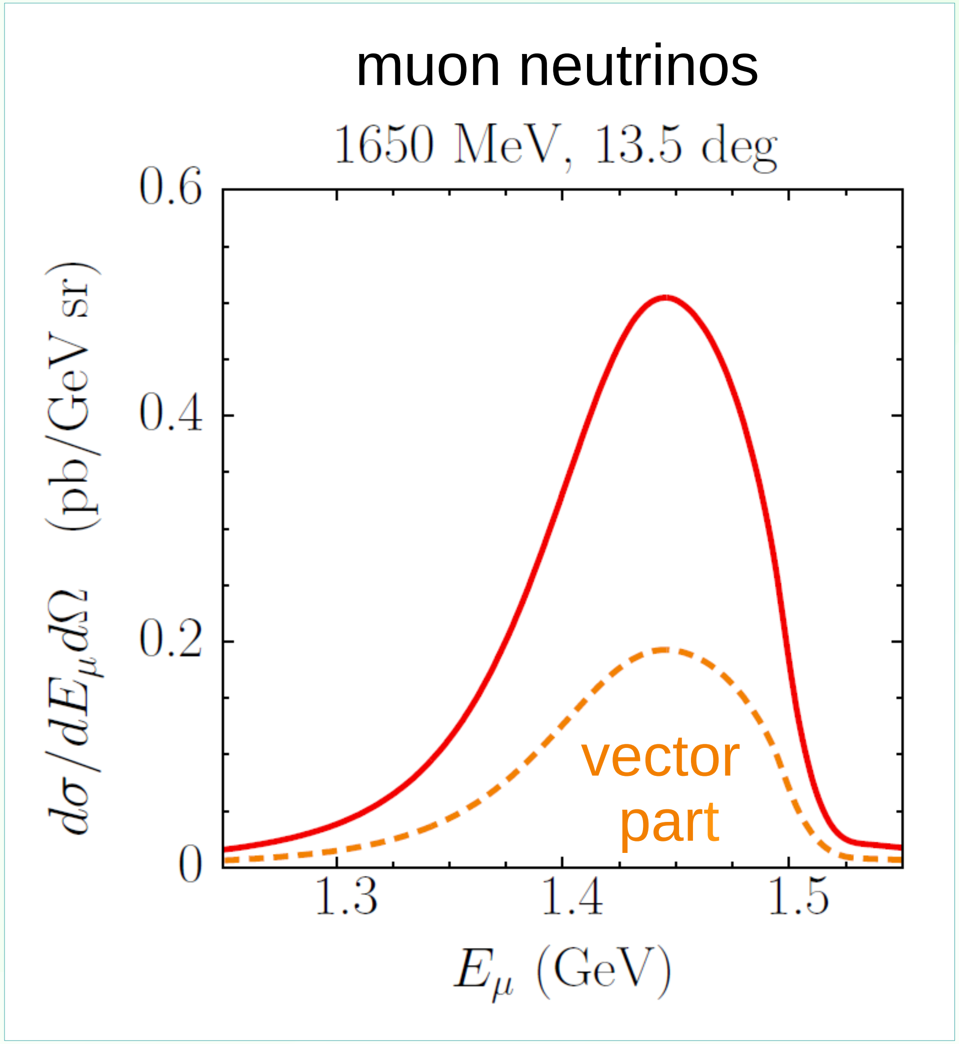
For scattering in a given angle, neutrinos and electrons differ only due to **the elementary cross section**.

In neutrino scattering, uncertainties come from (i) interaction dynamics and (ii) **nuclear effects.**

It is **highly improbable** that theoretical approaches unable to reproduce *(e,e')* data would describe nuclear effects in neutrino interactions at similar kinematics.

Much more than the vector part...





Can we trust our models and MCs?

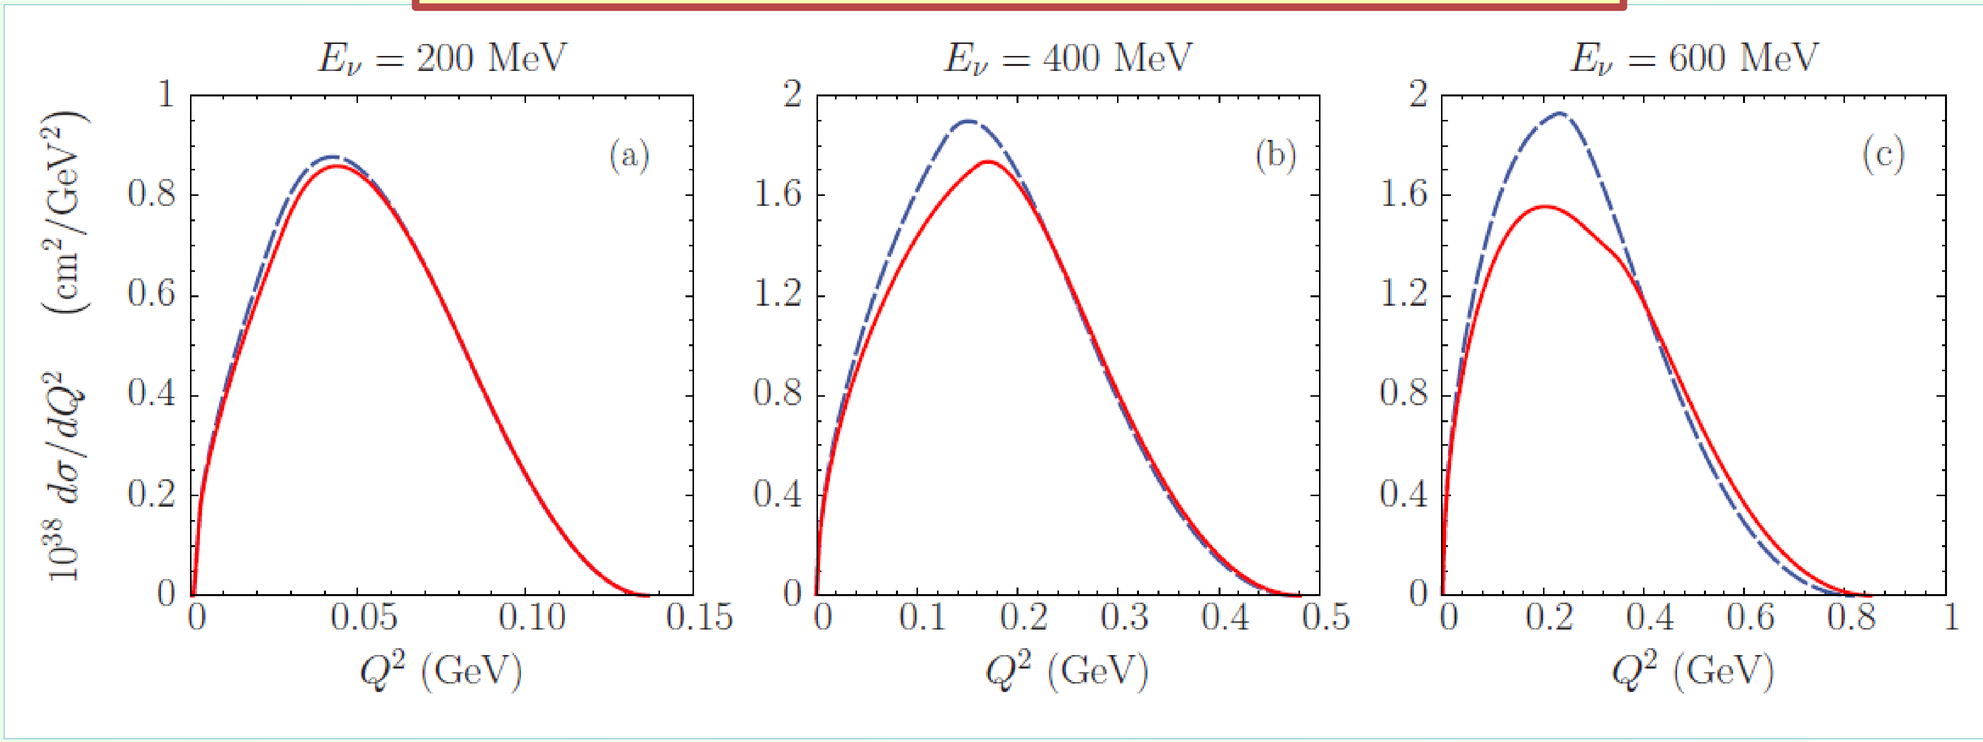
Can we trust our models and MCs?

“Trusting Too Much Kills You” by Bryan Teves

and lacking precision

Side remark: relativistic kinematics

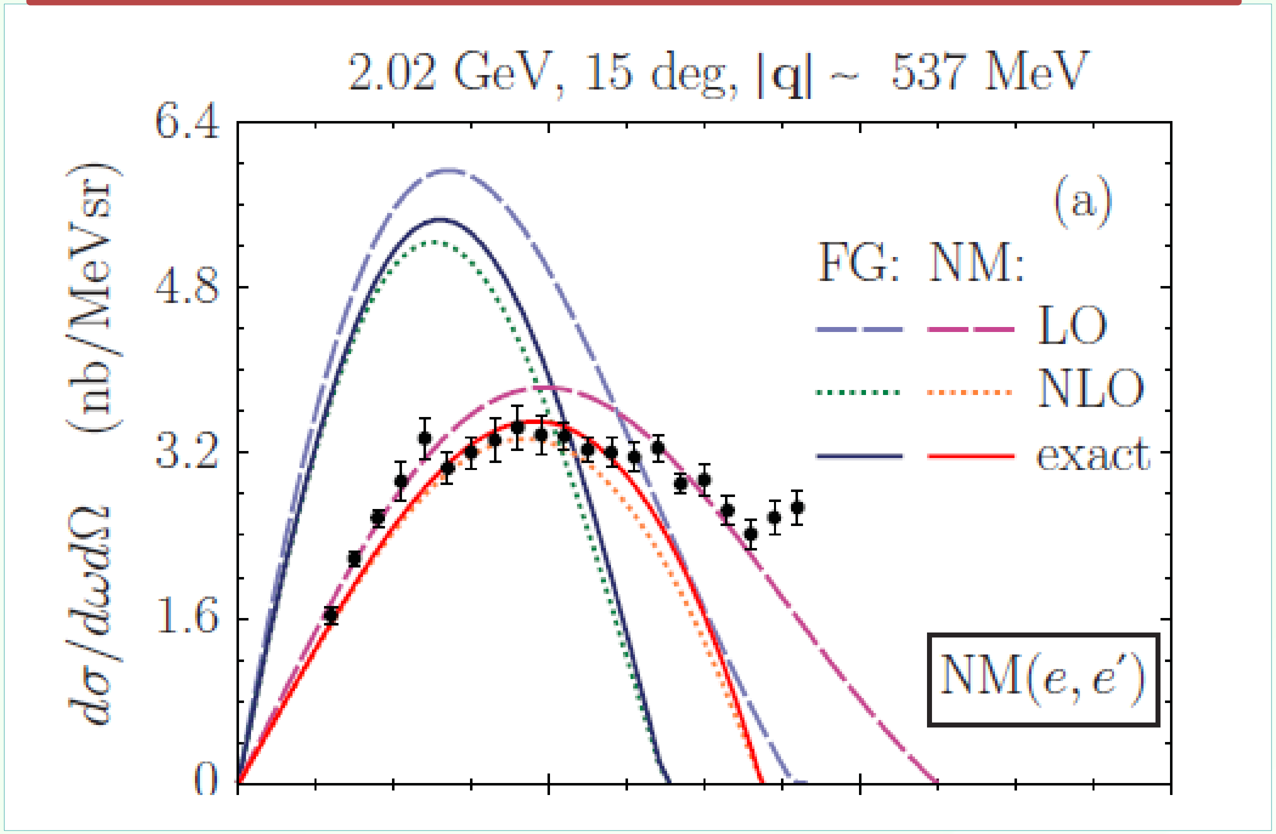
A.M.A. & O. Benhar, PRC 83, 054616 (2011)



Sizable differences between the **relativistic** and **nonrelativistic** results at neutrino energies ~500 MeV.

Side remark: relativistic kinematics

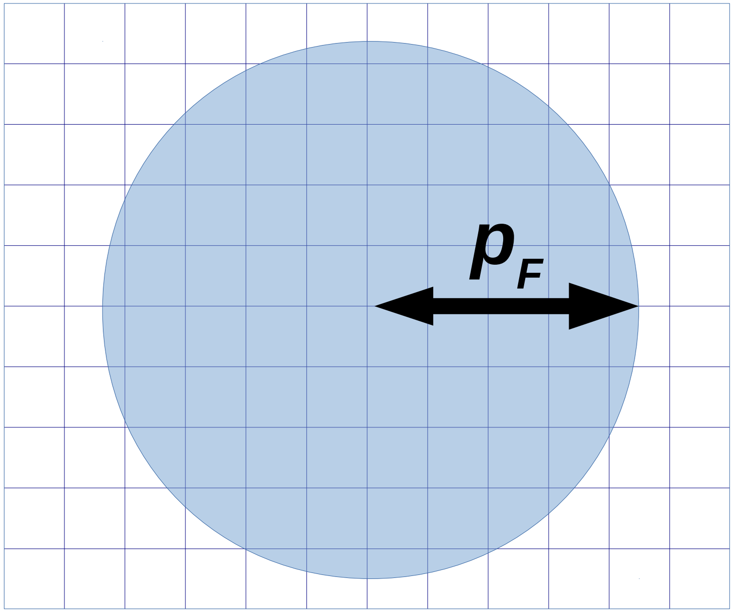
A.M.A. & O. Benhar, PRC 83, 054616 (2011)

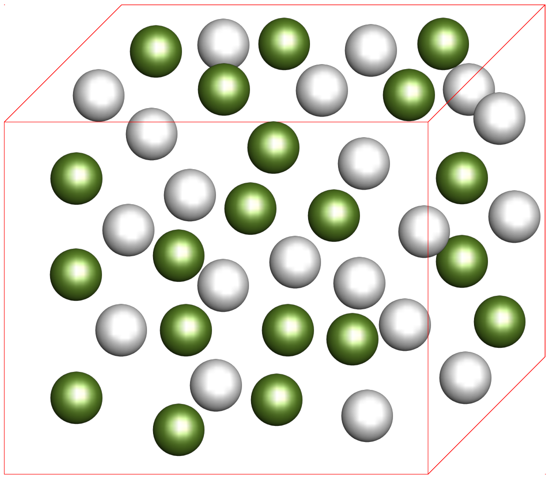


At |q|~540 MeV, semi-relativistic result is **5% lower** than the exact cross section.

Fermi gas model

In an infinite infinite space filled uniformly with nucleons, the eigenstates can be labeled using the momentum.





Momentum space

Coordinate space

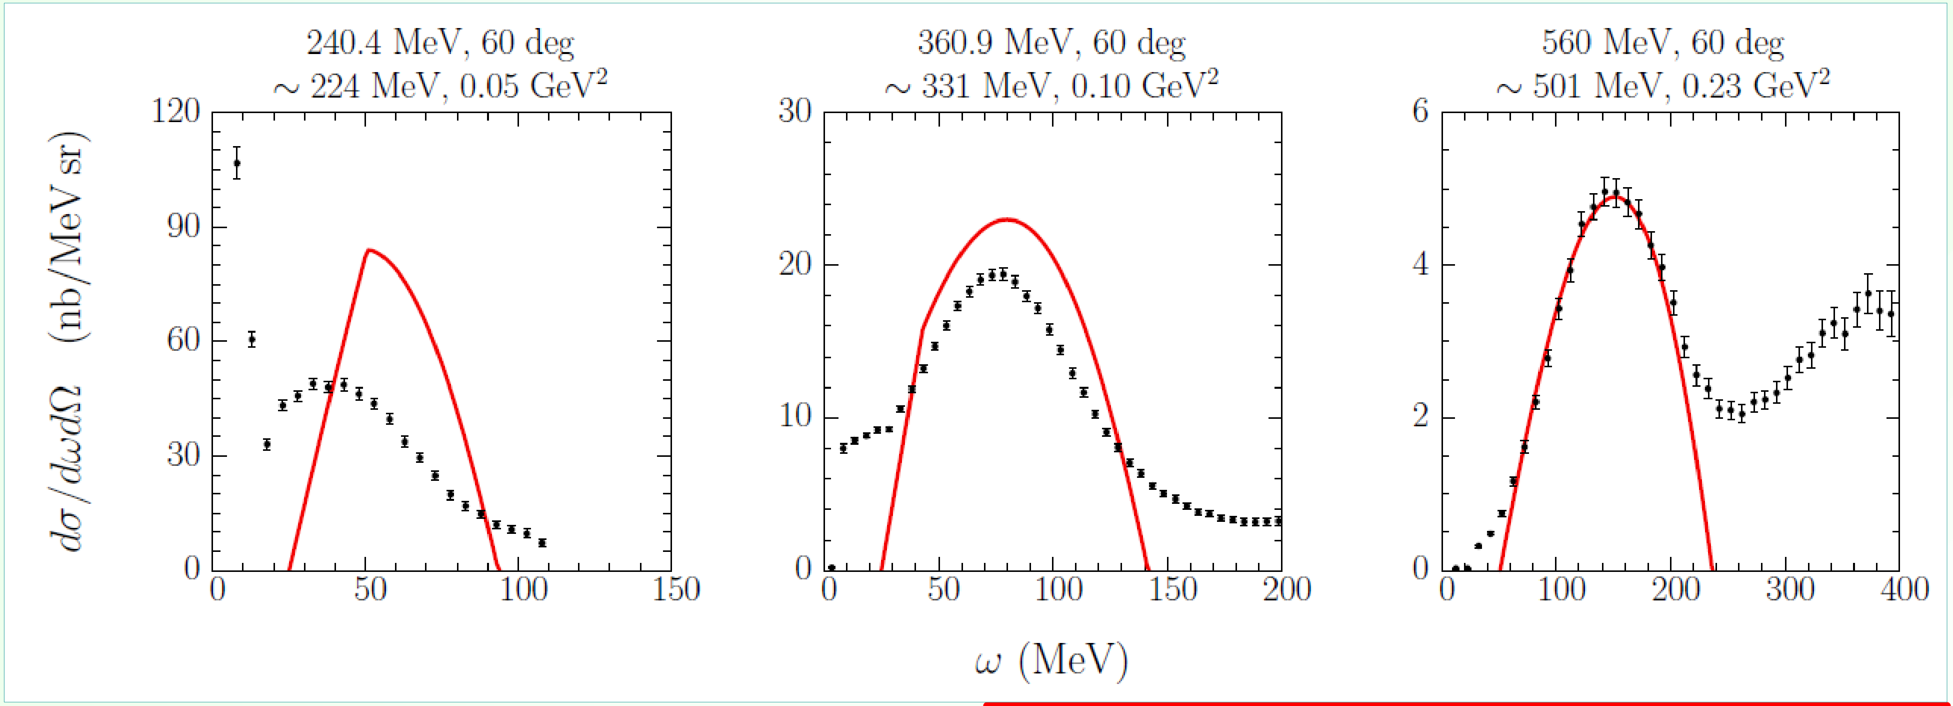
Whitney *et al.*, PRC 9, 2230 (1974)

Fermi gas model

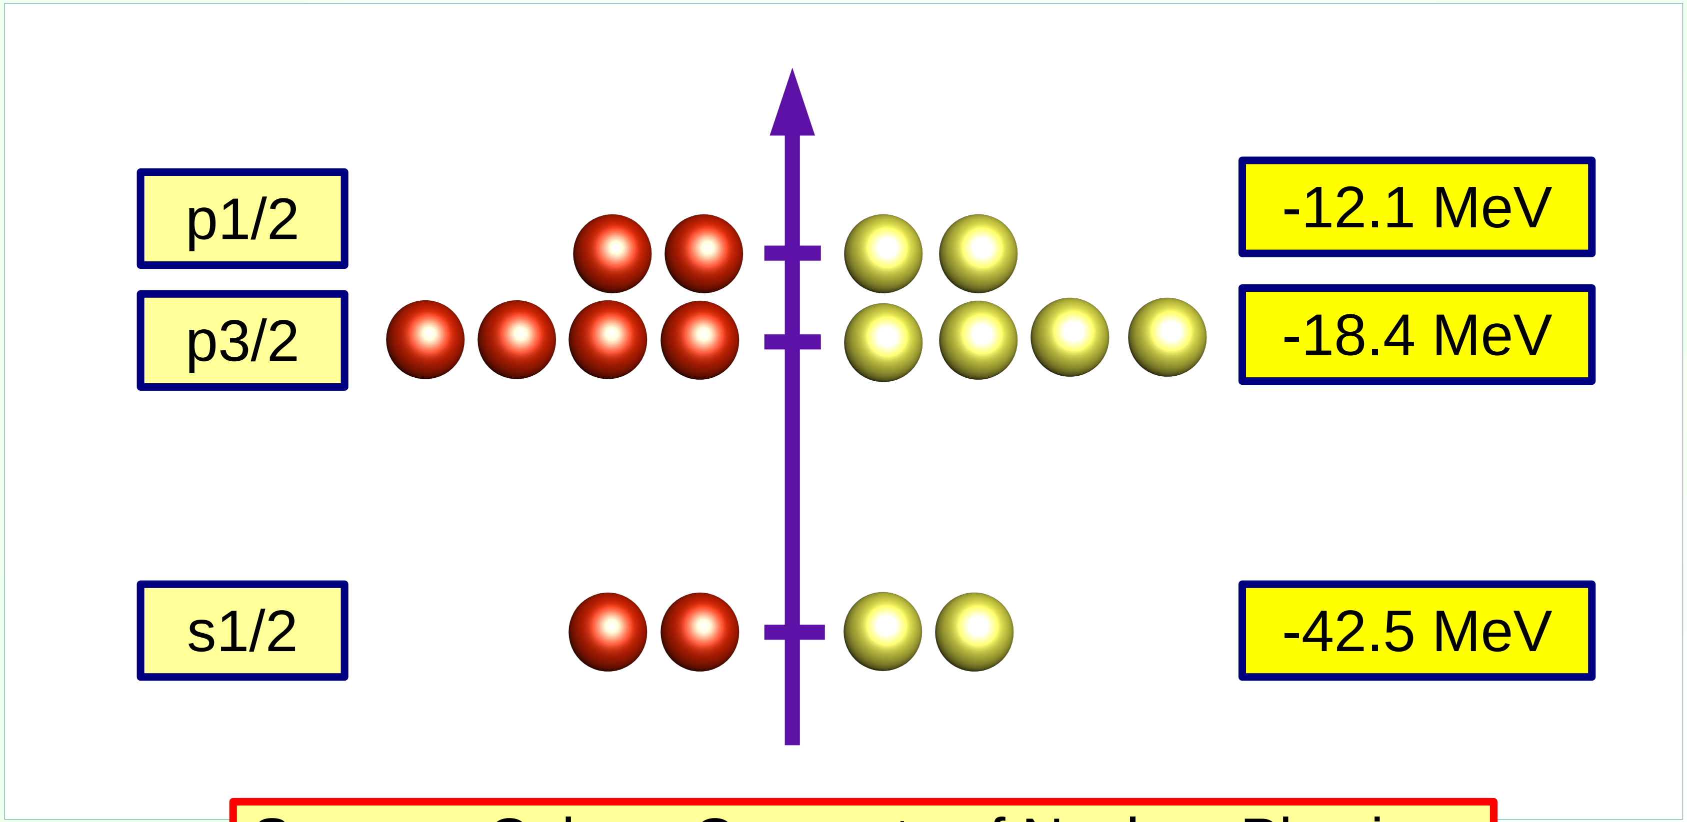
What happens at kinematics other than 500 MeV, 60 deg?



Barreau *et al.*, NPA 402, 515 (1983)

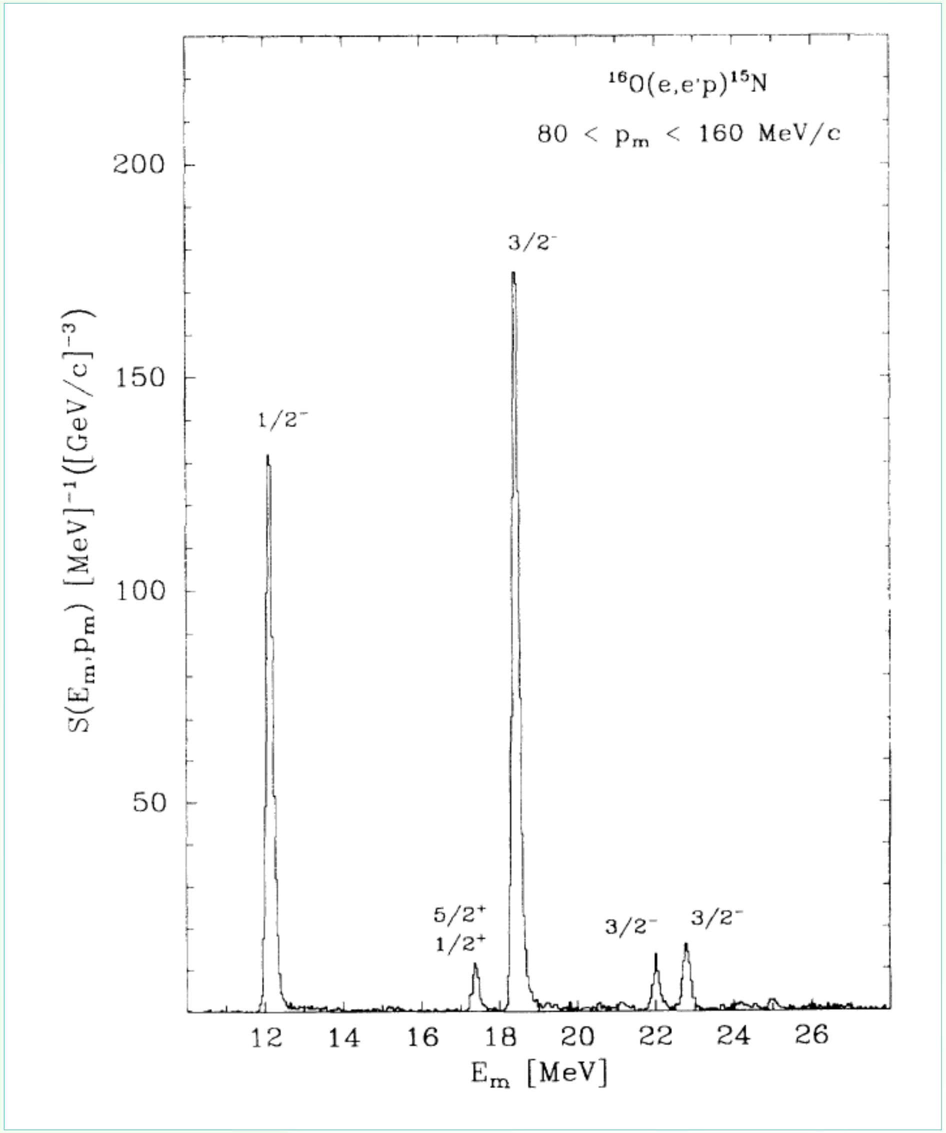
Shell model

In a spherically symmetric potential, the eigenstates can be labeled using the total angular momentum.



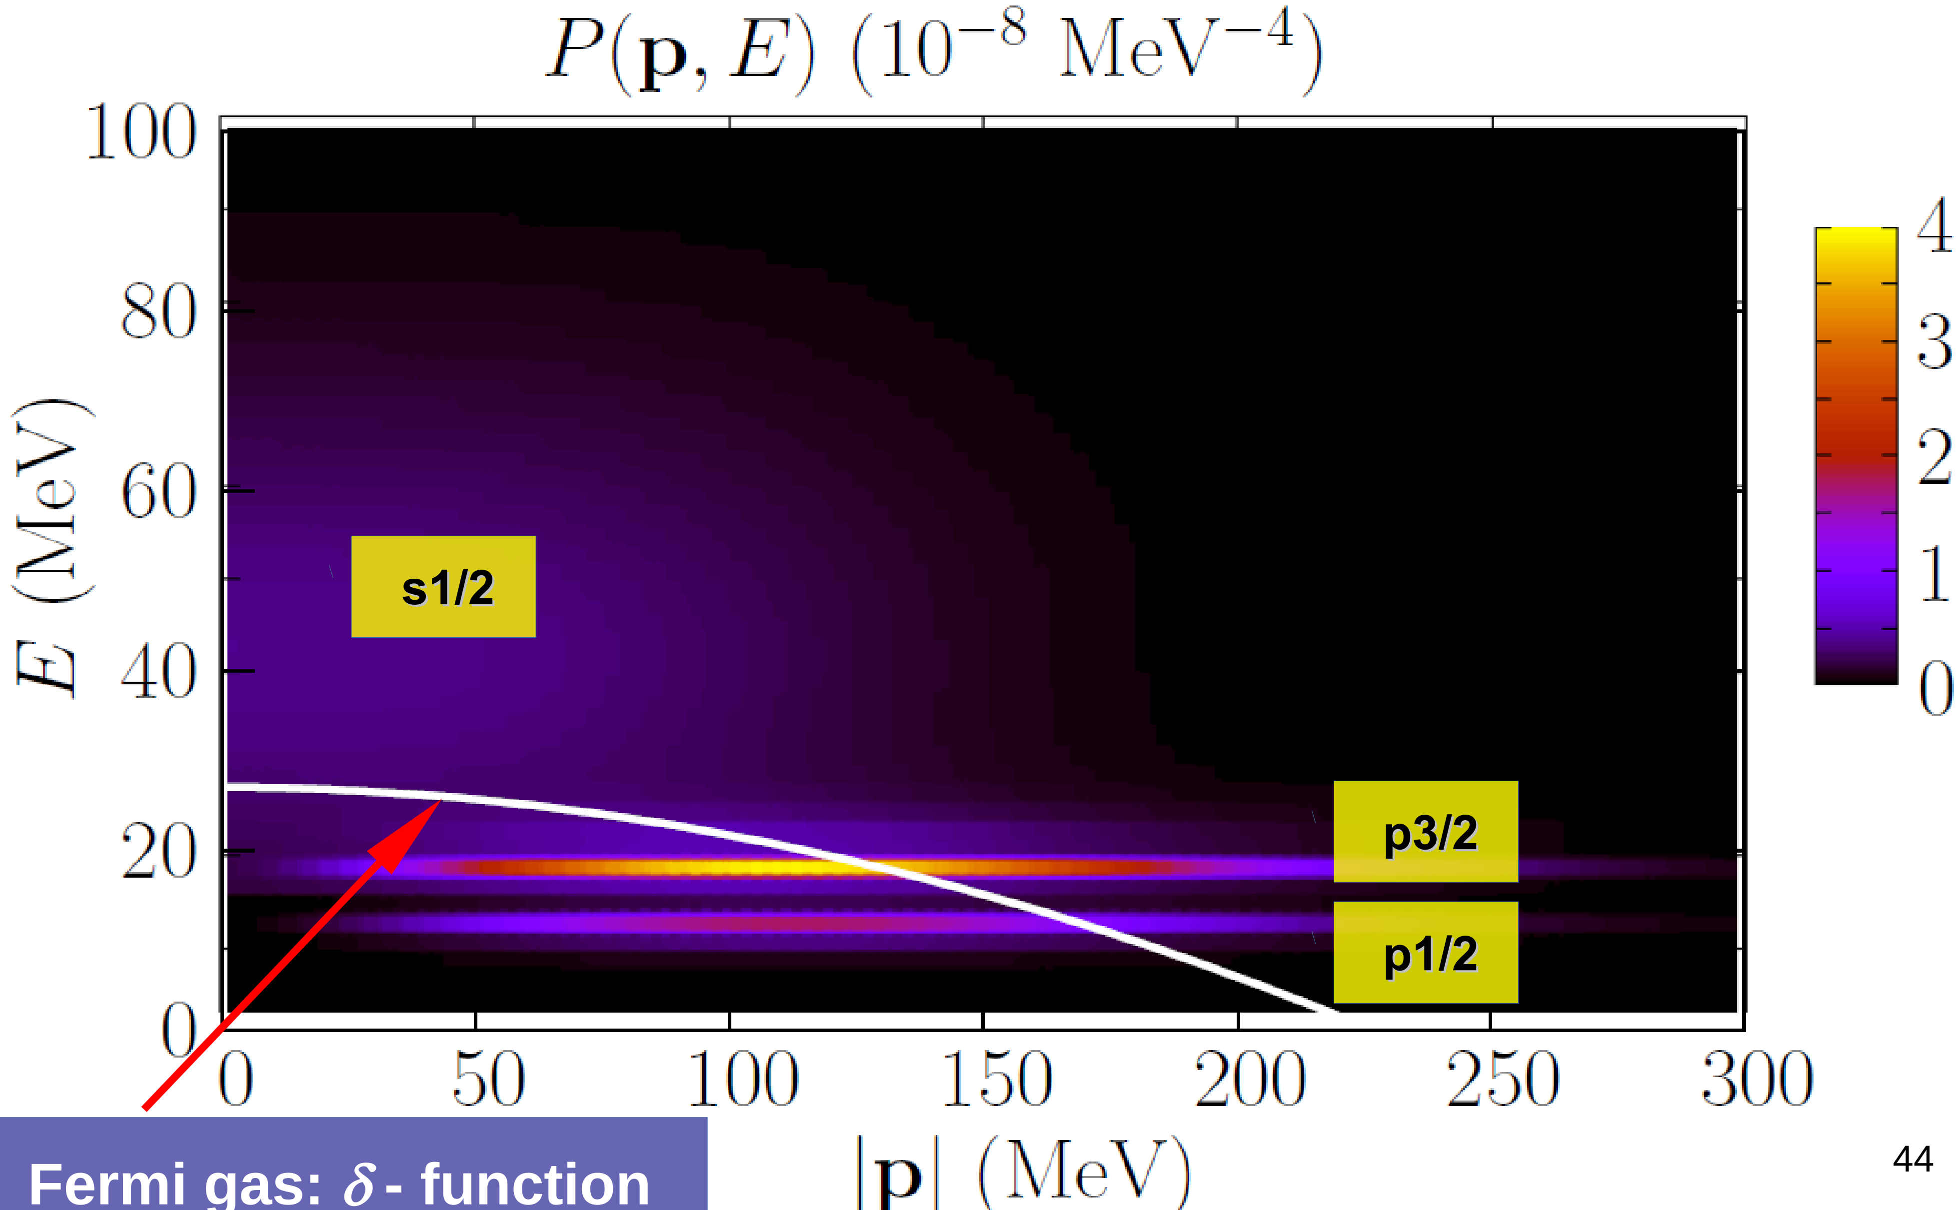
See e.g. Cohen, Concepts of Nuclear Physics, McGraw-Hill, 1971

Example: oxygen nucleus



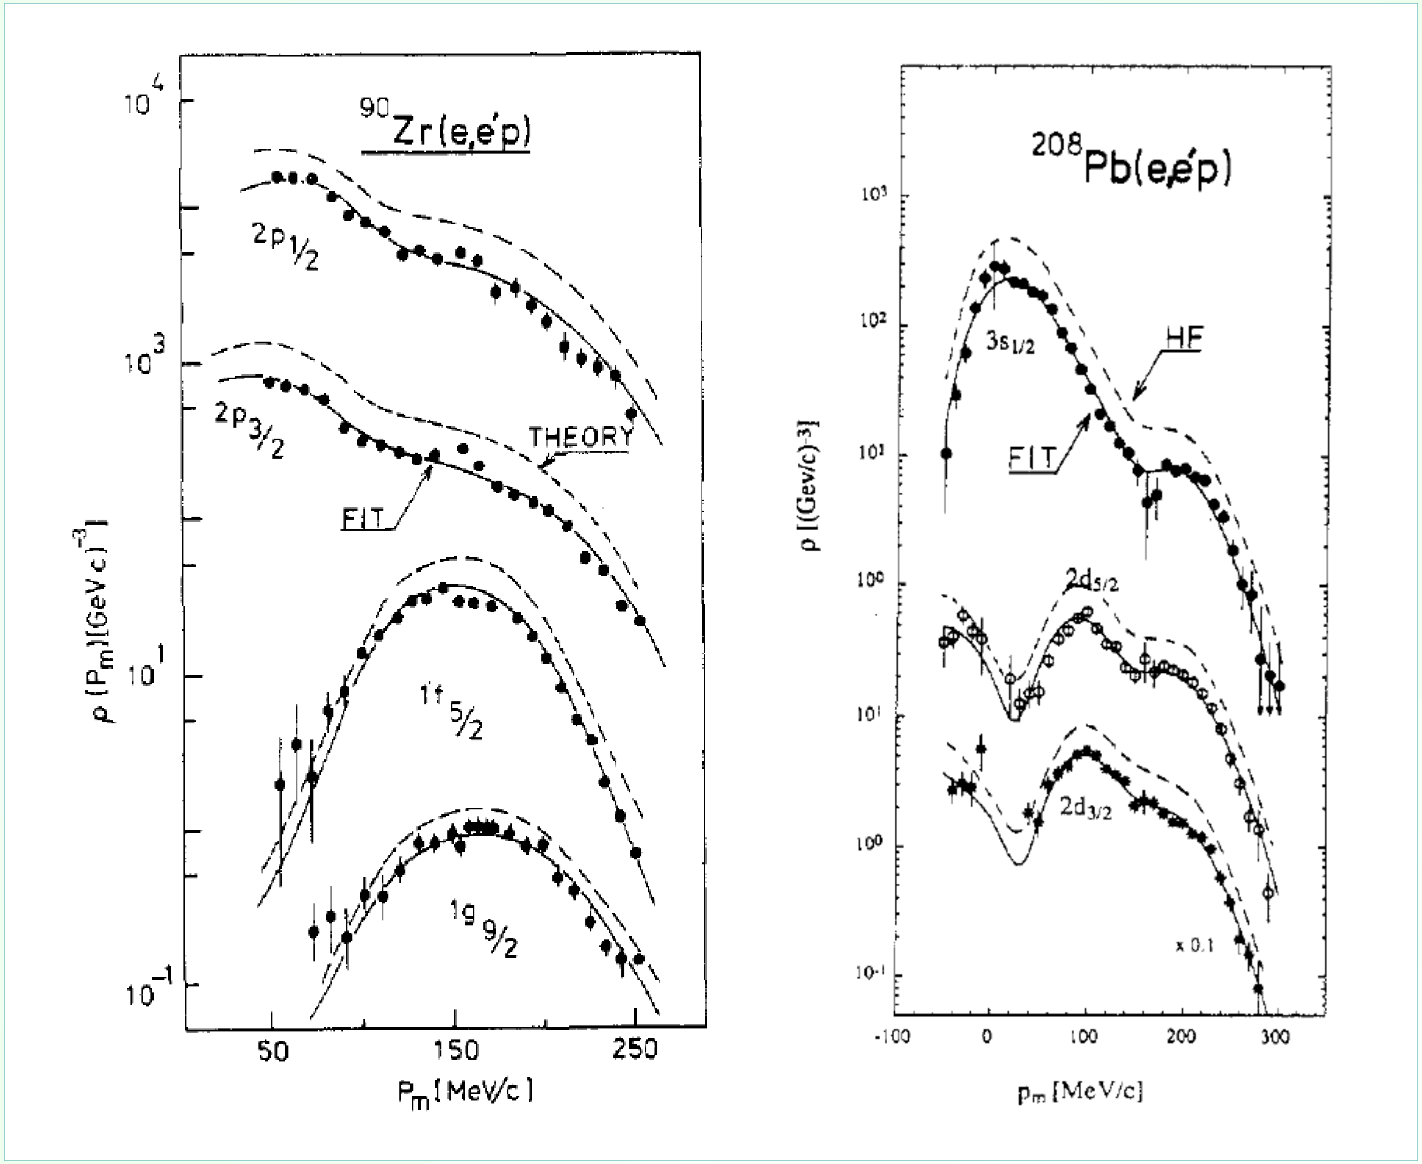
Leuschner *et al.*, PRC 49, 955 (1994)

Example: oxygen spectral function



Fermi gas: δ - function

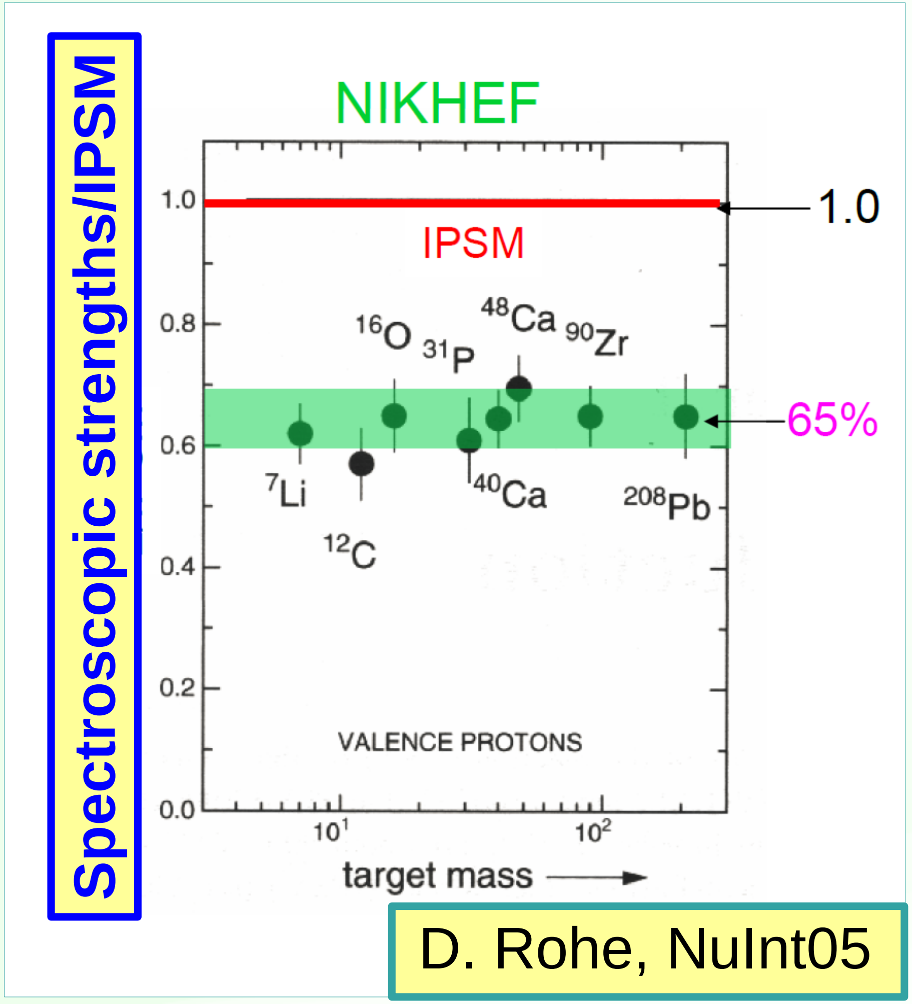
Depletion of the shell-model states



De Witt Huberts, JPG 16, 507 (1990)

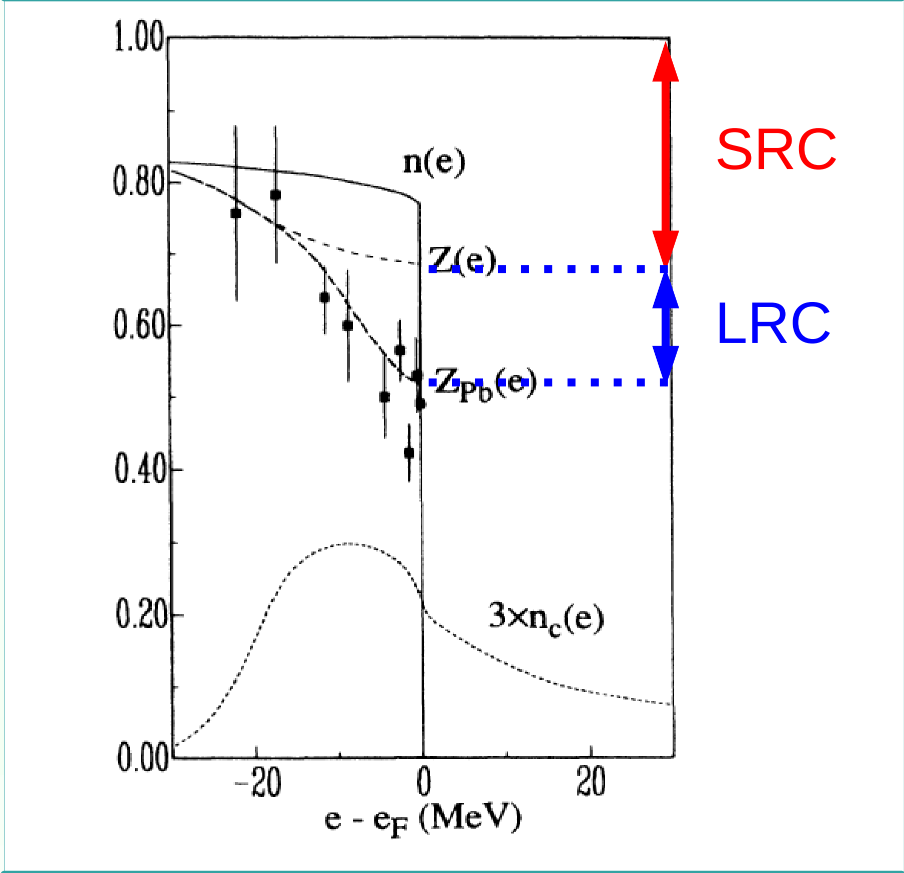
Depletion of the shell-model states

The observed depletion is ~35% for the valence shells (LRC and SRC) and ~20% when higher missing energy is probed (SRC).



D. Rohe, NuInt05

NIKHEF: ^{208}Pb(e,e'p)^{207}Tl



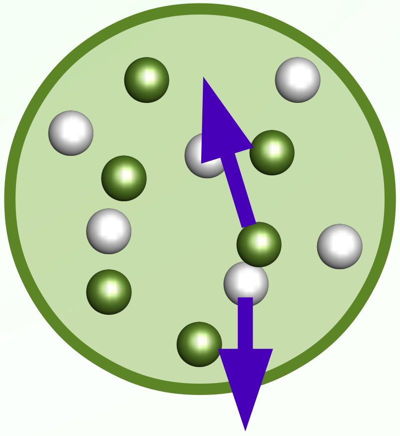
Benhar et al, PRC 41, R24 (1990)

Spectral function approach

Short-range correlations

The main source of the depletion of the shell-model states at high *E* are **short-range nucleon-nucleon correlations**.

Yielding NN pairs (typically pn pairs) with high relative momentum, they move ~20% of nucleons to the states of high removal energies.



Short-range correlations

The hole spectral function can be expressed as

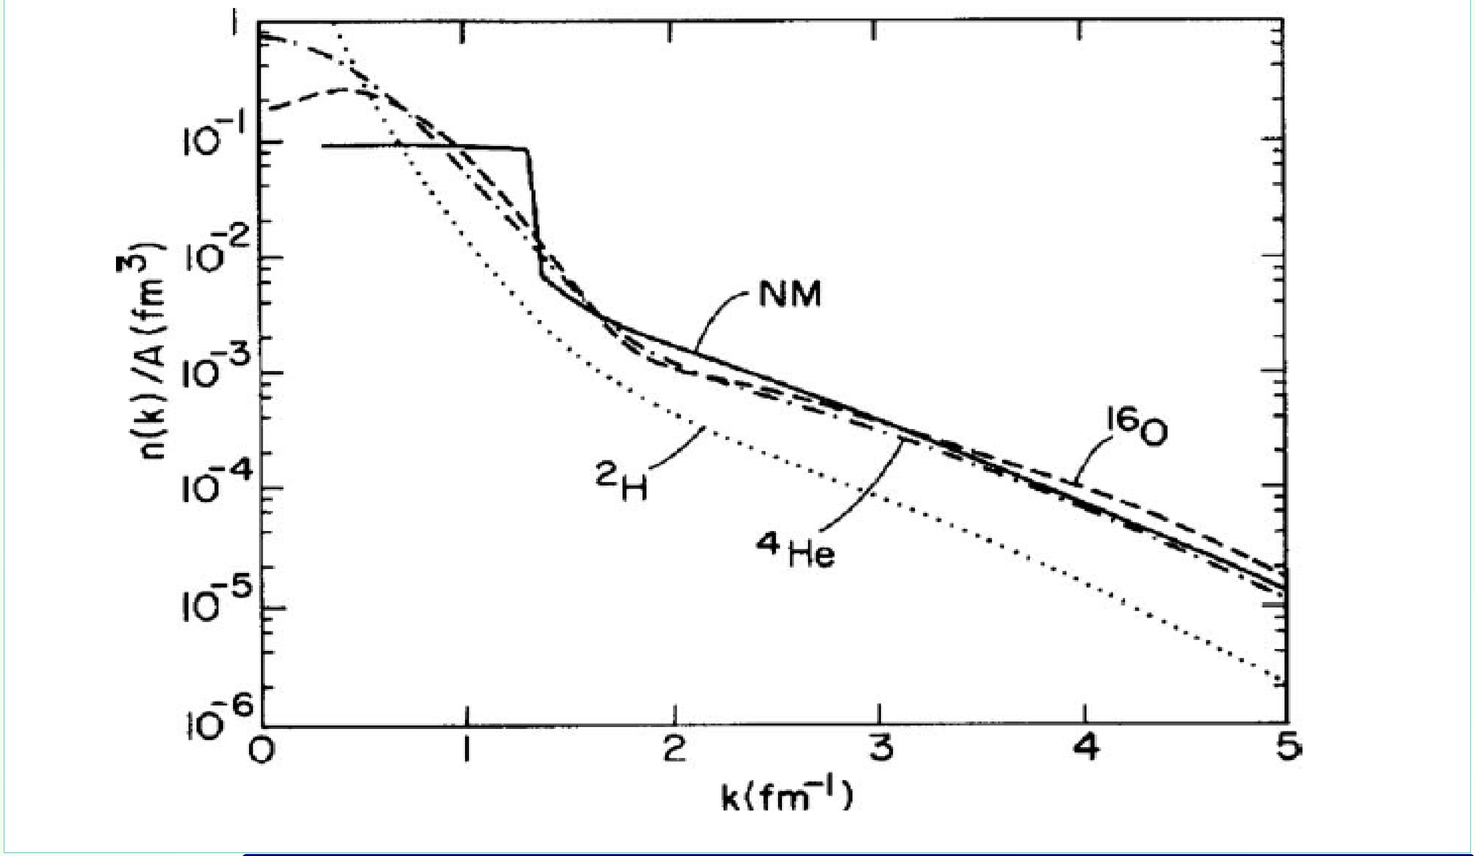
$$P_N(\mathbf{p}, E) = \underbrace{\sum_\alpha n_\alpha |\phi_\alpha|^2 f_\alpha(E - E_\alpha^N)}_{\text{describes the contribution of the shell-model states, vanishes at high }|p|\text{ or high }E} + \underbrace{P_{\rm corr}^N(\mathbf{p}, E)}_{\text{relevant only at high }|p|\text{ and }E},$$

describes the contribution of the shell-model states, vanishes at high |p| or high *E*

relevant only at high |p| **and** *E*

Short-range correlations

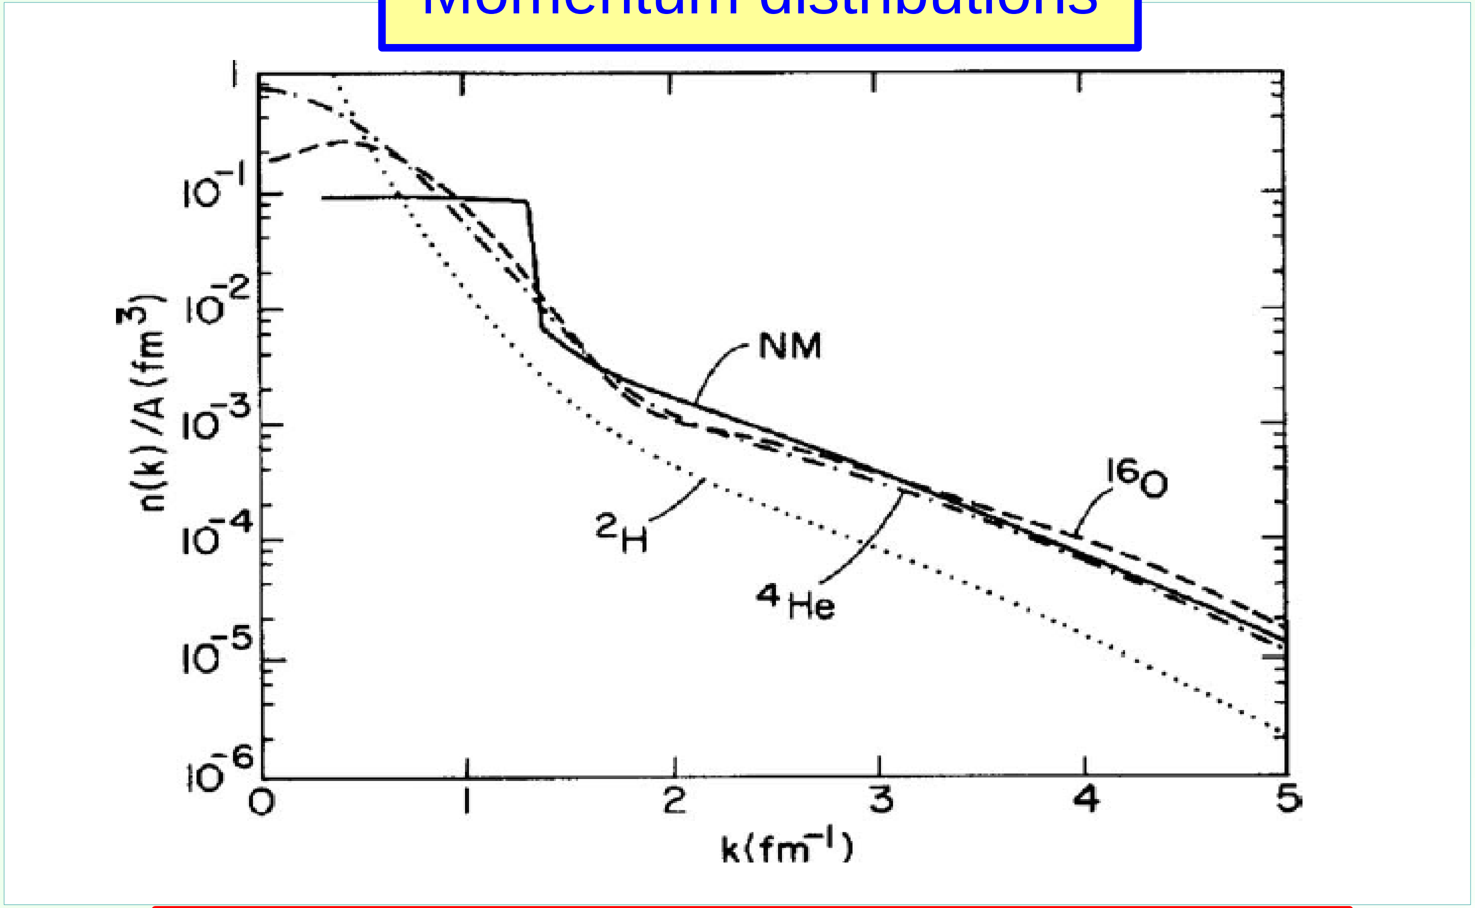
Momentum distributions



Benhar&Pandharipande, RMP 65, 817 (1993)

Short-range correlations

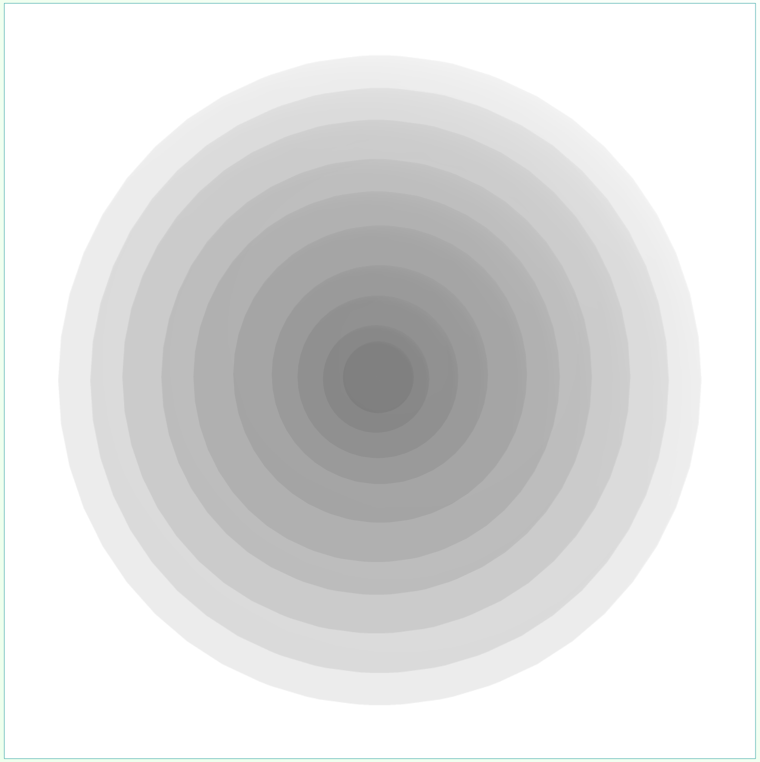
Momentum distributions



SRC don't depend on the shell structure
or finite-size effects, only on the density

Local-density approximation

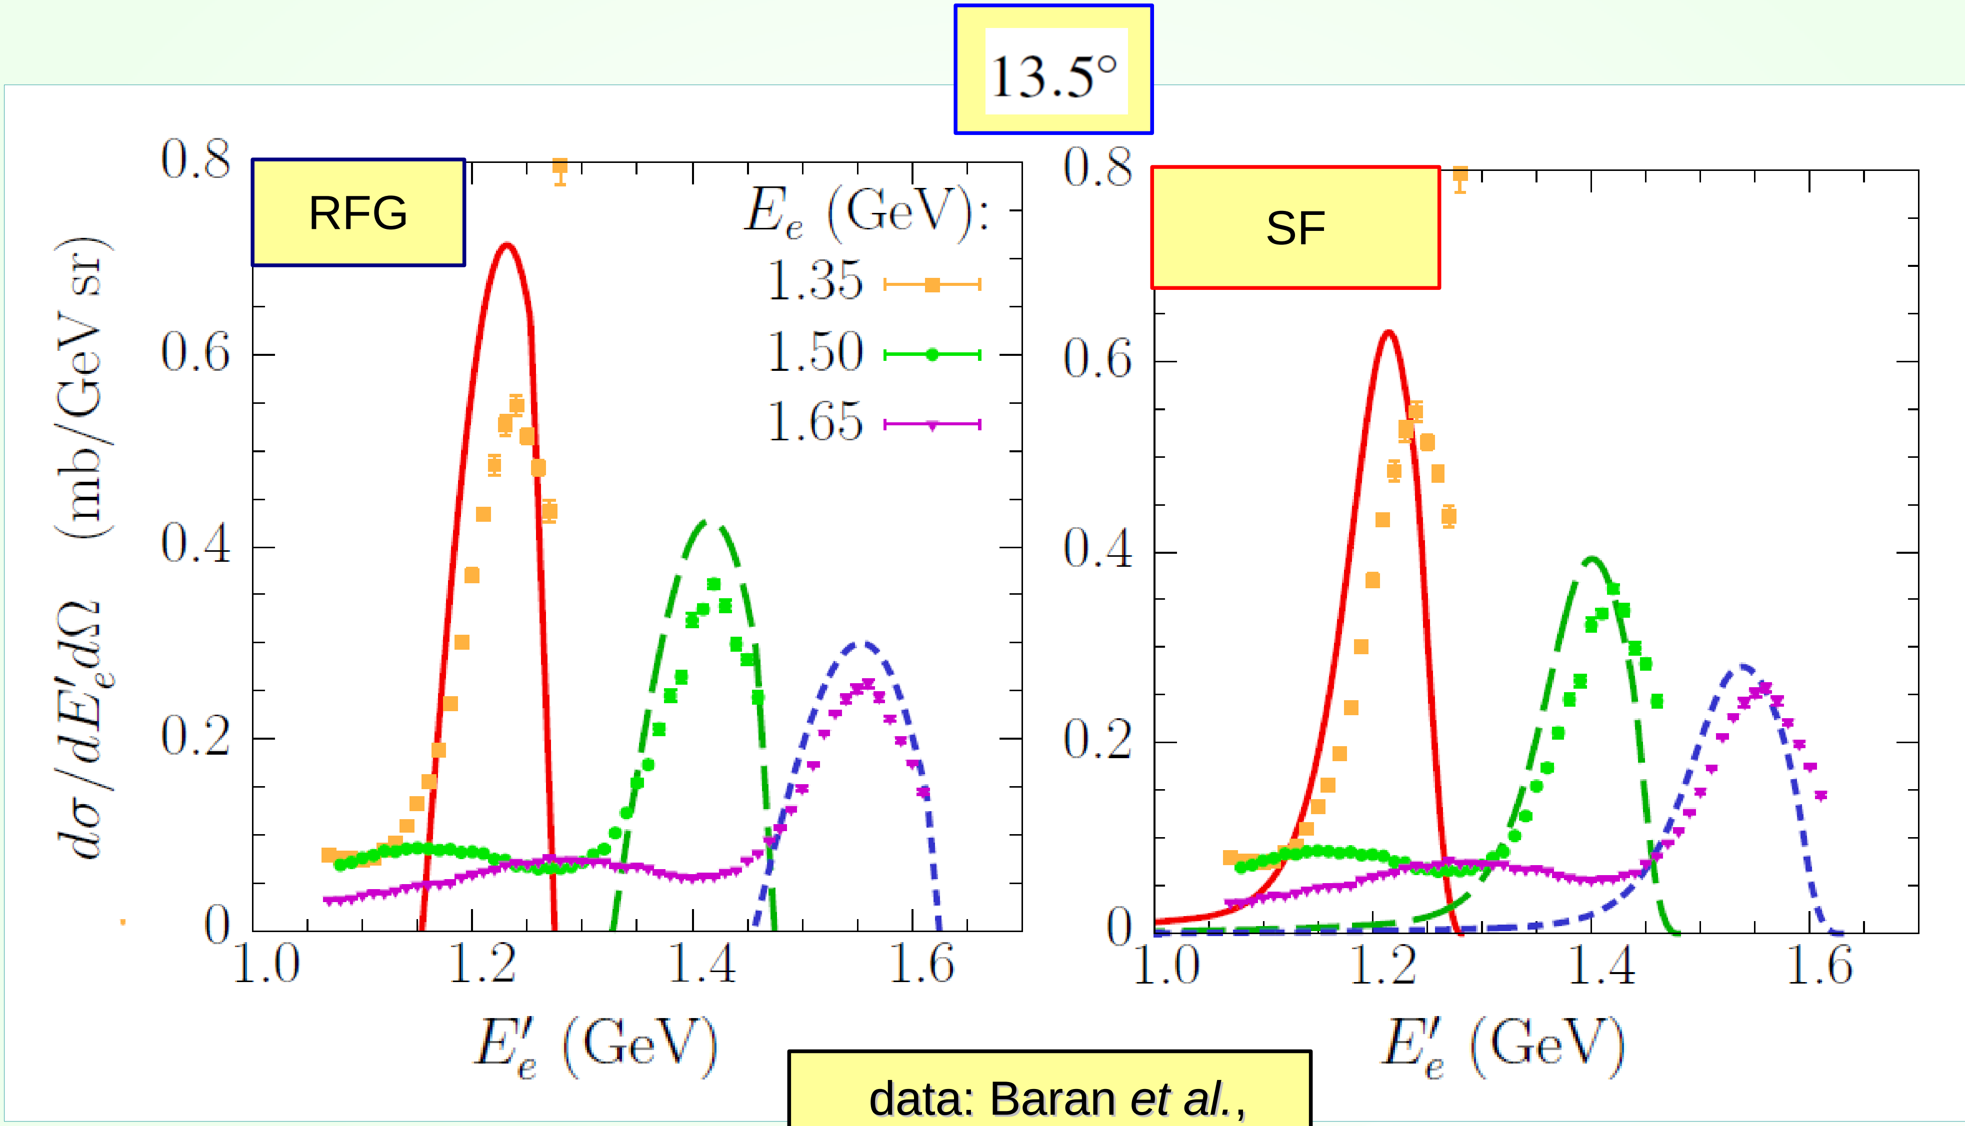
The correlation component in nuclei can be obtained combining the results for infinite nuclear matter obtained at different densities:



$$P^N_{\rm corr}(\mathbf{p}, E) = \int dR \rho(R) P^{NM,N}_{\rm corr}(\rho, \mathbf{p}, E).$$

Benhar *et al.*, NPA 579 493, (1994)

Comparison to C(e, e') data



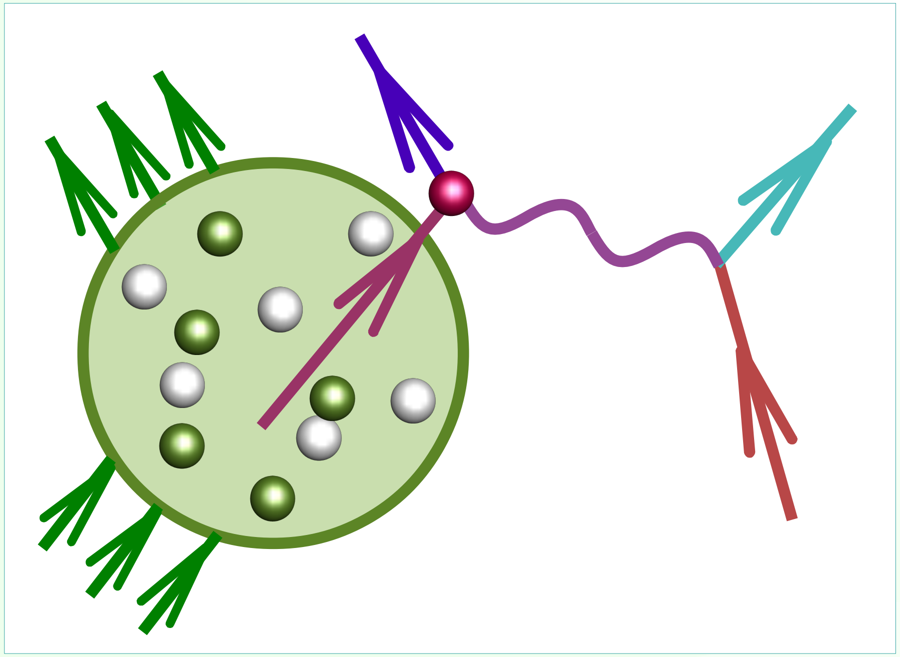
data: Baran *et al.*, PRL 61, 400 (1988)

Energy conservation

$$E_{\mathbf{k}} + M_A = E_{\mathbf{k}'} + E_{A-1} + E_{\mathbf{p}'}$$

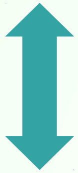
Energy conservation

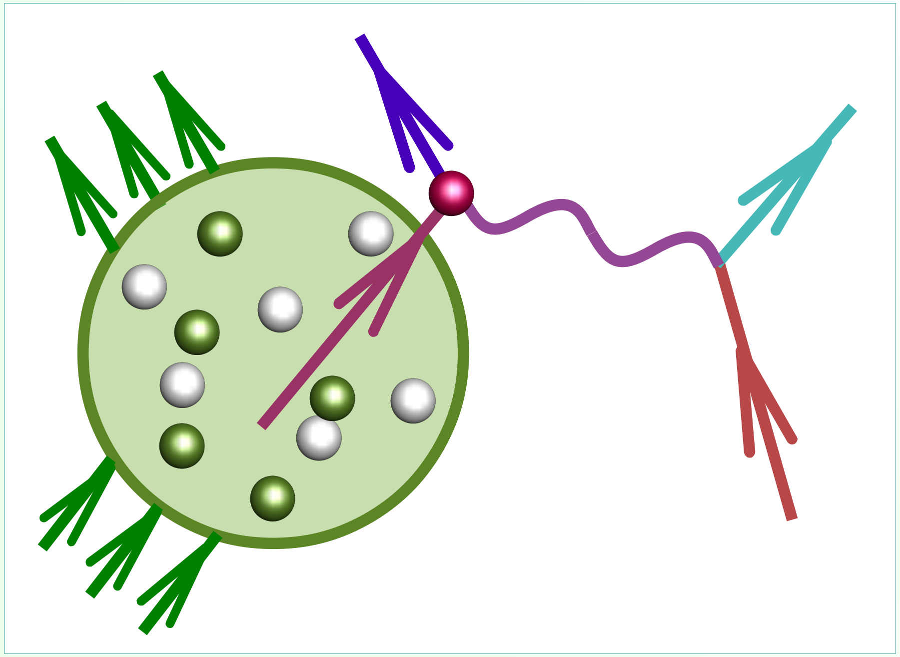
$$E_{\mathbf{k}} + M_A = E_{\mathbf{k}'} + E_{A-1} + E_{\mathbf{p}'}$$

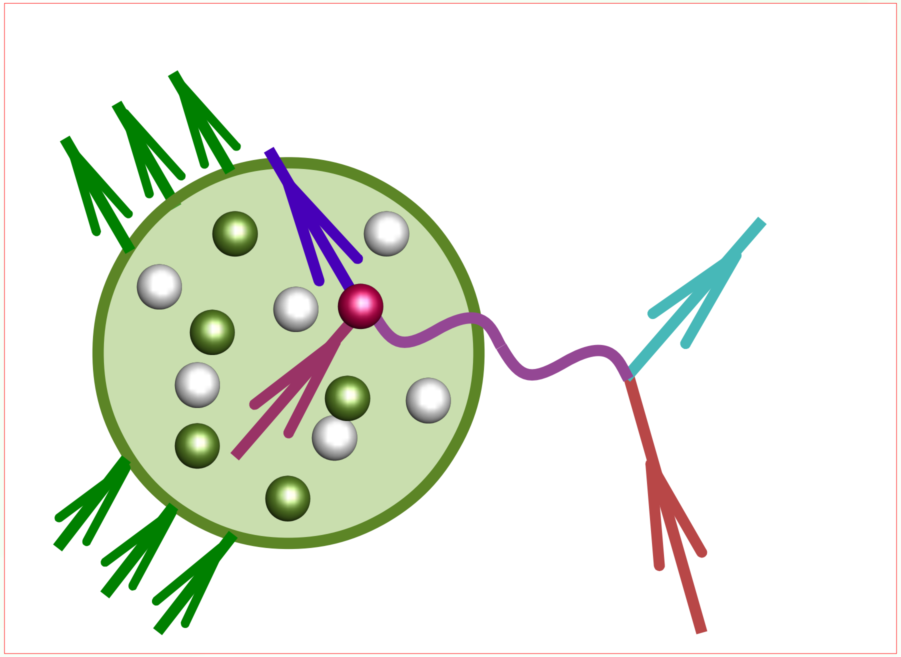


Energy conservation

$$E_{\mathbf{k}} + M_A = E_{\mathbf{k}'} + E_{A-1} + E_{\mathbf{p}'}$$



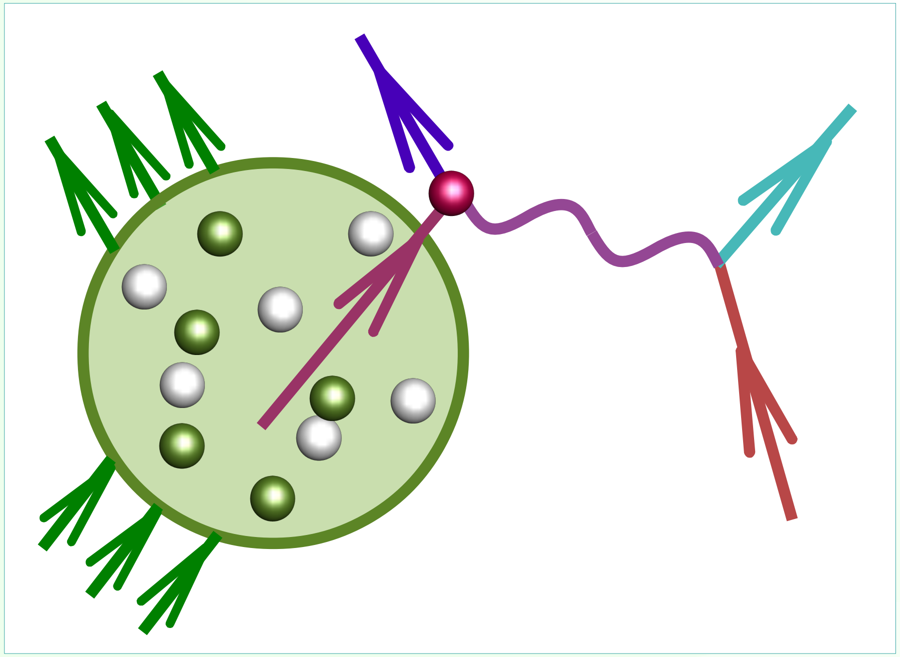


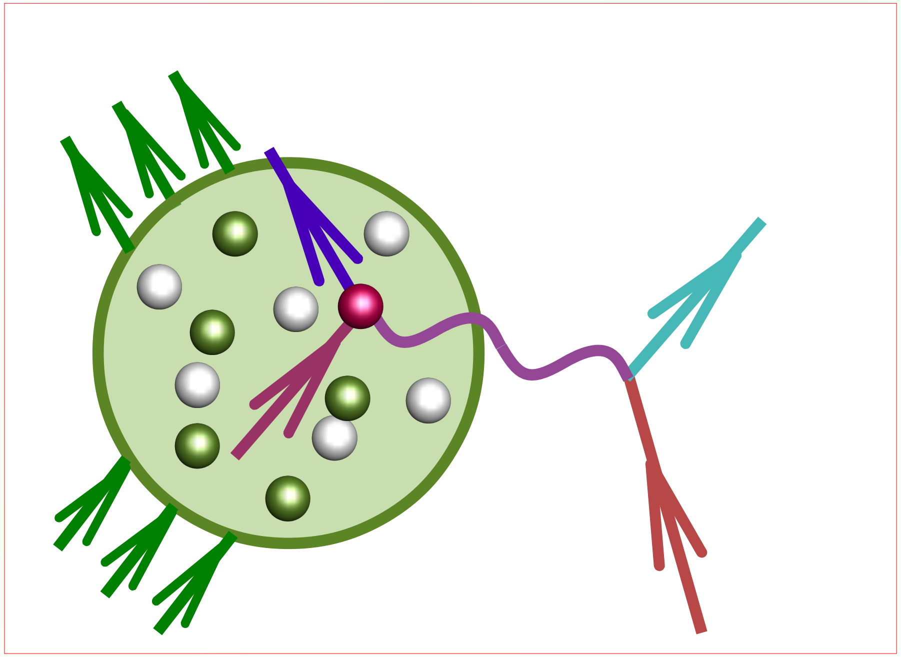


Energy conservation

$$E_{\mathbf{k}} + M_A = E_{\mathbf{k}'} + E_{A-1} + E_{\mathbf{p}'}$$

$$E_{\mathbf{k}} + M_A = E_{\mathbf{k}'} + E_{A-1} + E_{\mathbf{p}'} + U_V(\mathbf{p}')$$

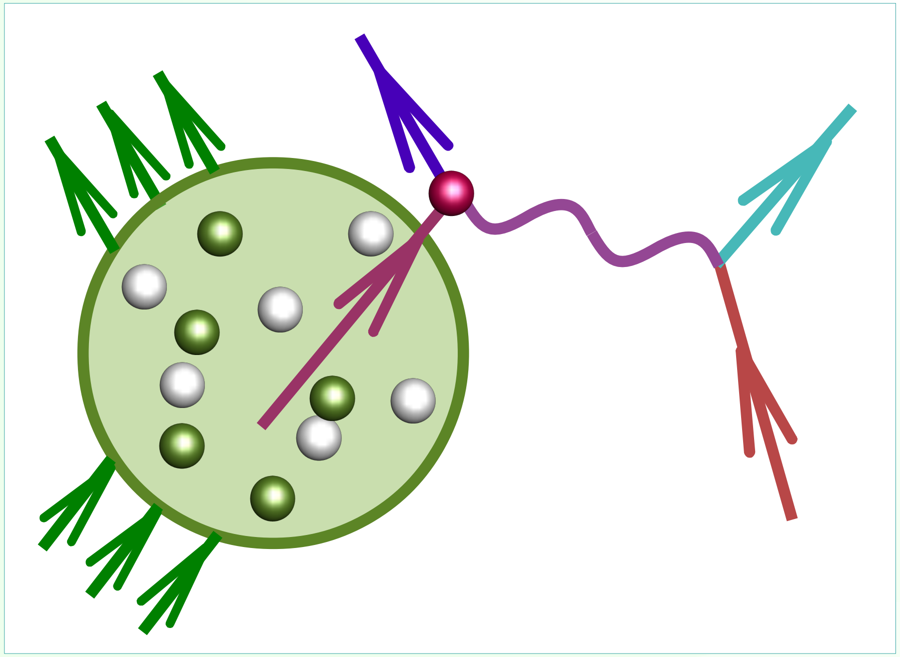


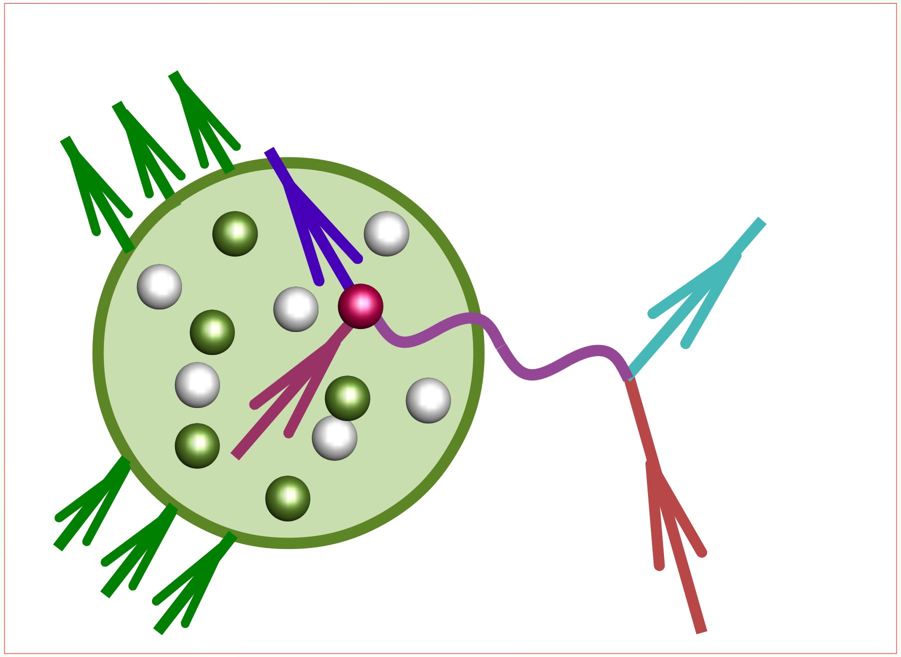


Energy conservation

$$E_{\mathbf{k}} + M_A = E_{\mathbf{k}'} + E_{A-1} + E_{\mathbf{p}'}$$

$$E_{\mathbf{k}} + M_A \boxed{\sim} E_{\mathbf{k}'} + E_{A-1} + E_{\mathbf{p}'} + U_V(\mathbf{p}')$$





Final-state interactions

Their effect on the cross section is easy to understand in terms of the complex optical potential:

- the **real part** modifies the struck nucleon's energy spectrum: it differes from $\sqrt{M^2+\boldsymbol{p}'^2}$
- the **imaginary part** reduces the single-nucleon final states and produces multinucleon final states

$$\boxed{e^{i(E+U)t} = e^{i(E+U_V)t}e^{-U_W t}}$$

Horikawa *et al.*, PRC 22, 1680 (1980)

Final-state interactions

In the convolution approach,

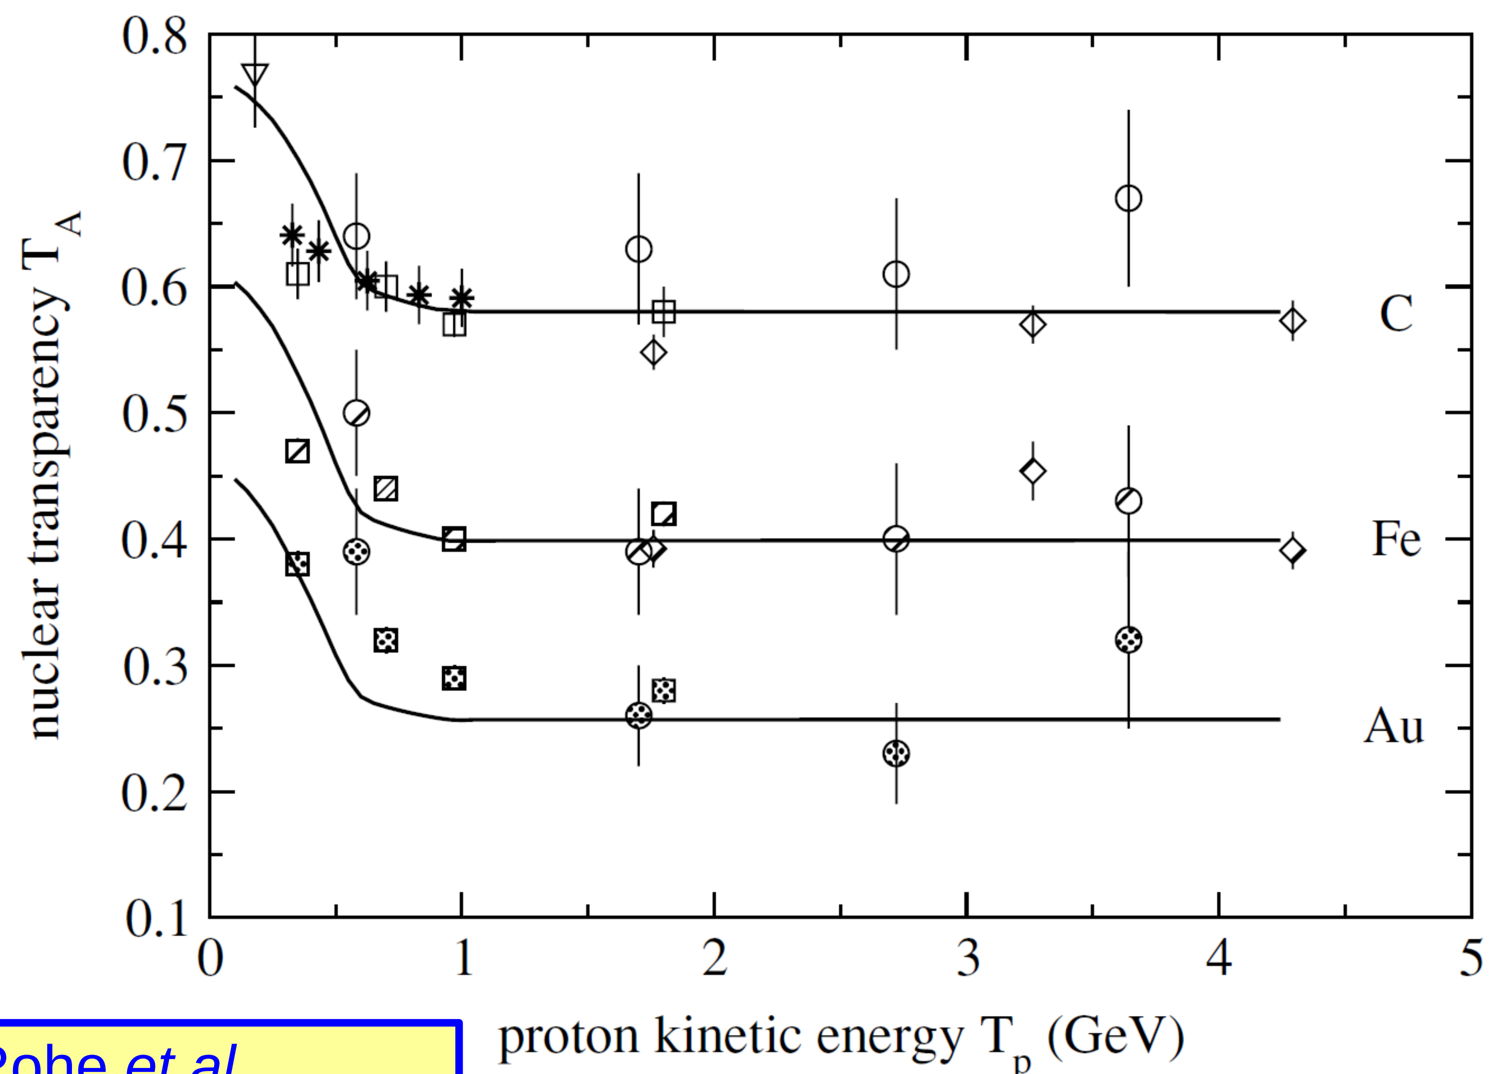
$$\frac{d\sigma^{\mathrm{FSI}}}{d\omega d\Omega} = \int d\omega' f_{\mathbf{q}}(\omega - \omega') \frac{d\sigma^{\mathrm{IA}}}{d\omega' d\Omega},$$

with the folding function

$$f_{\mathbf{q}}(\omega) = \delta(\omega)\sqrt{T_A} + \left(1 - \sqrt{T_A}\right) F_{\mathbf{q}}(\omega),$$

Nucl. transparency

Nuclear transparency



Rohe *et al.*,
PRC 72, 054602 (2005)

Real part of the optical potential

We account for the spectrum modification by

$$f_{\mathbf{q}}(\omega - \omega') \to f_{\mathbf{q}}(\omega - \omega' - U_V).$$

This procedure is similar to that from the Fermi gas model to introduce the binding energy in the argument of $\delta(...)$.

$$U_V = U_V(t_{\mathrm{kin}})$$

$$t_{\mathrm{kin}} = \frac{E_{\mathbf{k}}^2(1-\cos\theta)}{M + E_{\mathbf{k}}(1-\cos\theta)}$$

Optical potential by Cooper *et al.*

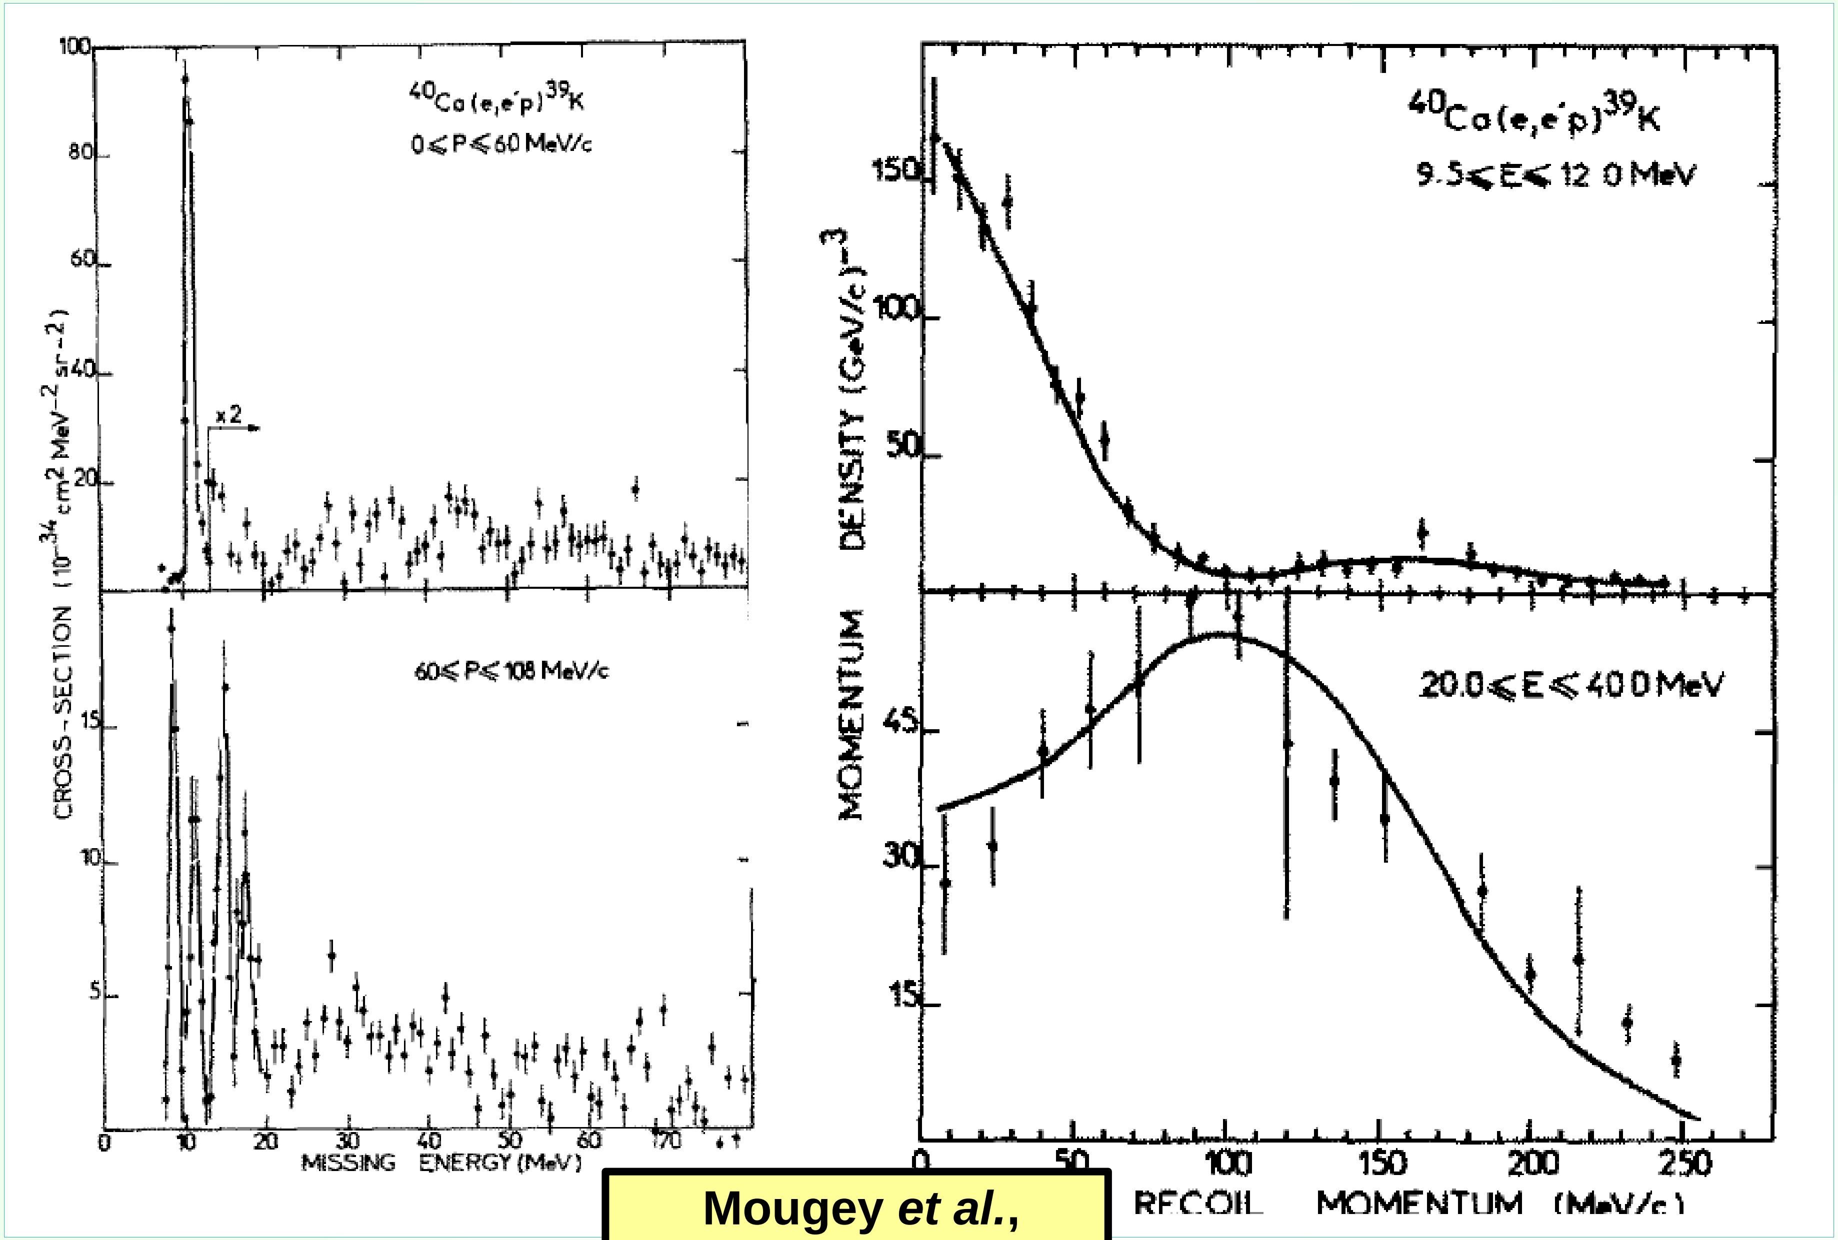
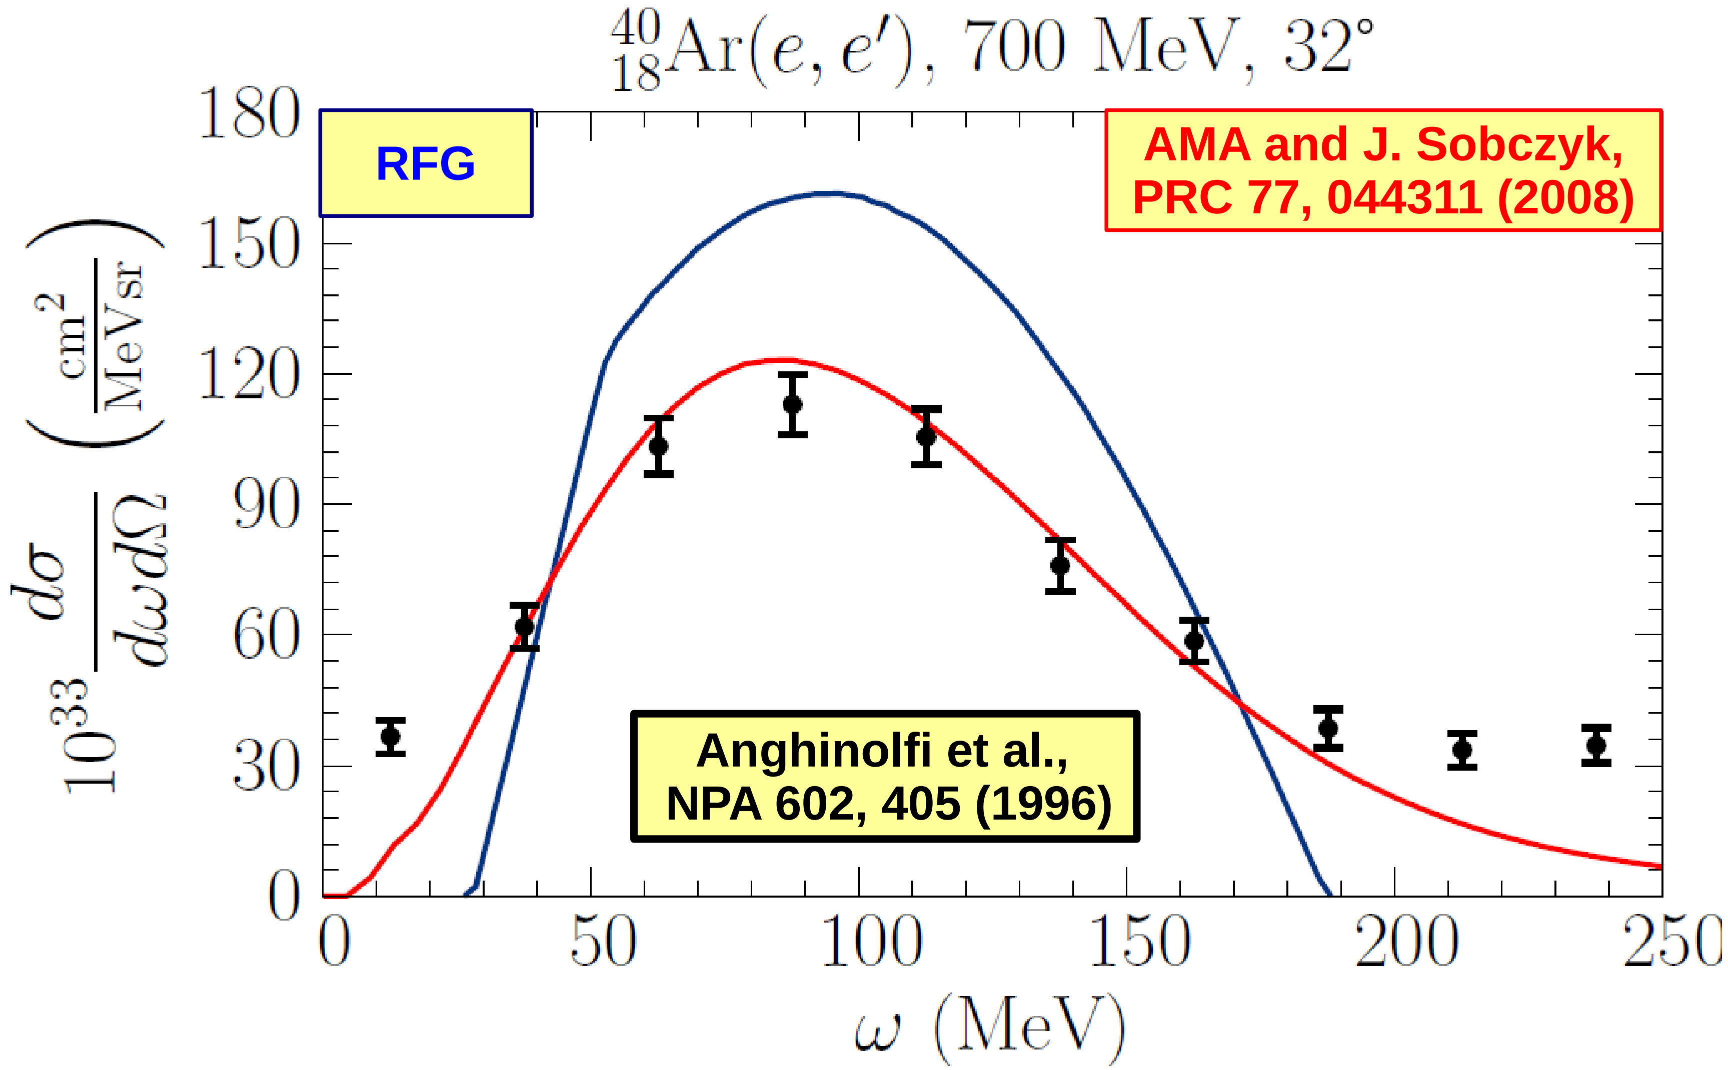
Spectral function of ^{40}Ca



Mougey *et al.*,
NPA 262, 461 (1976)

Approximated SF of ^{40}Ar



Experiment E12-14-012 at JLab

"We propose a measurement of the coincidence (e,e'p) cross section on argon. This data will provide the experimental input indispensable to construct the argon spectral function, thus paving the way for a reliable estimate of the neutrino cross sections."

Benhar *et al.*, arXiv:1406.4080

Experiment E12-14-012 at JLab

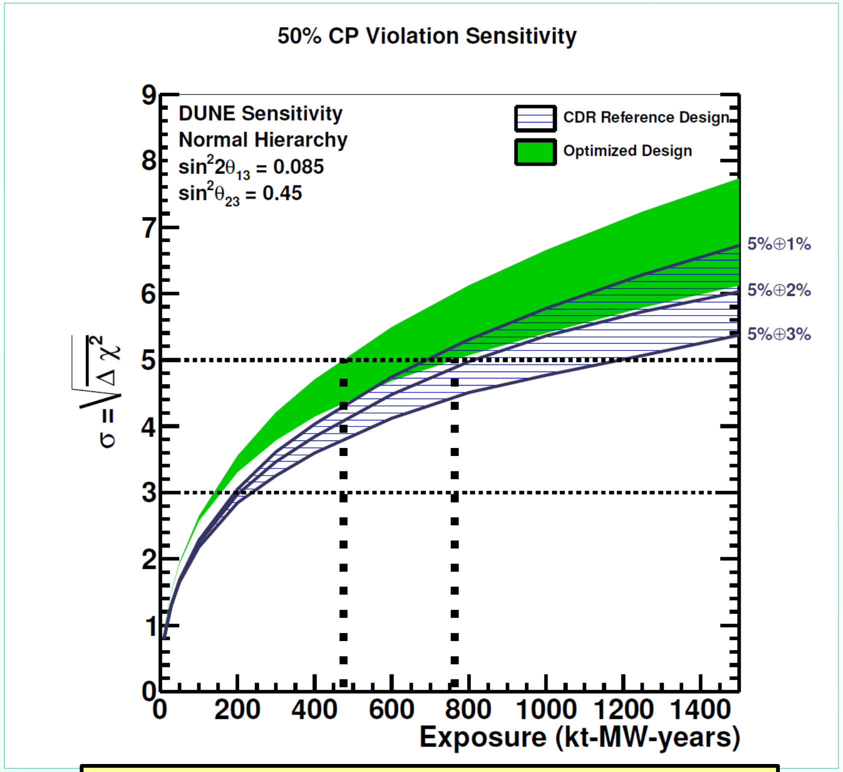
Primary goal: extraction of the proton shell structure of ^{40}Ar from (*e*,*e'p*) scattering

- spectroscopic factors,
- energy distributions,
- momentum distributions.

Secondary goal: improved description of final-state interactions in the argon nucleus.

Physics motivation

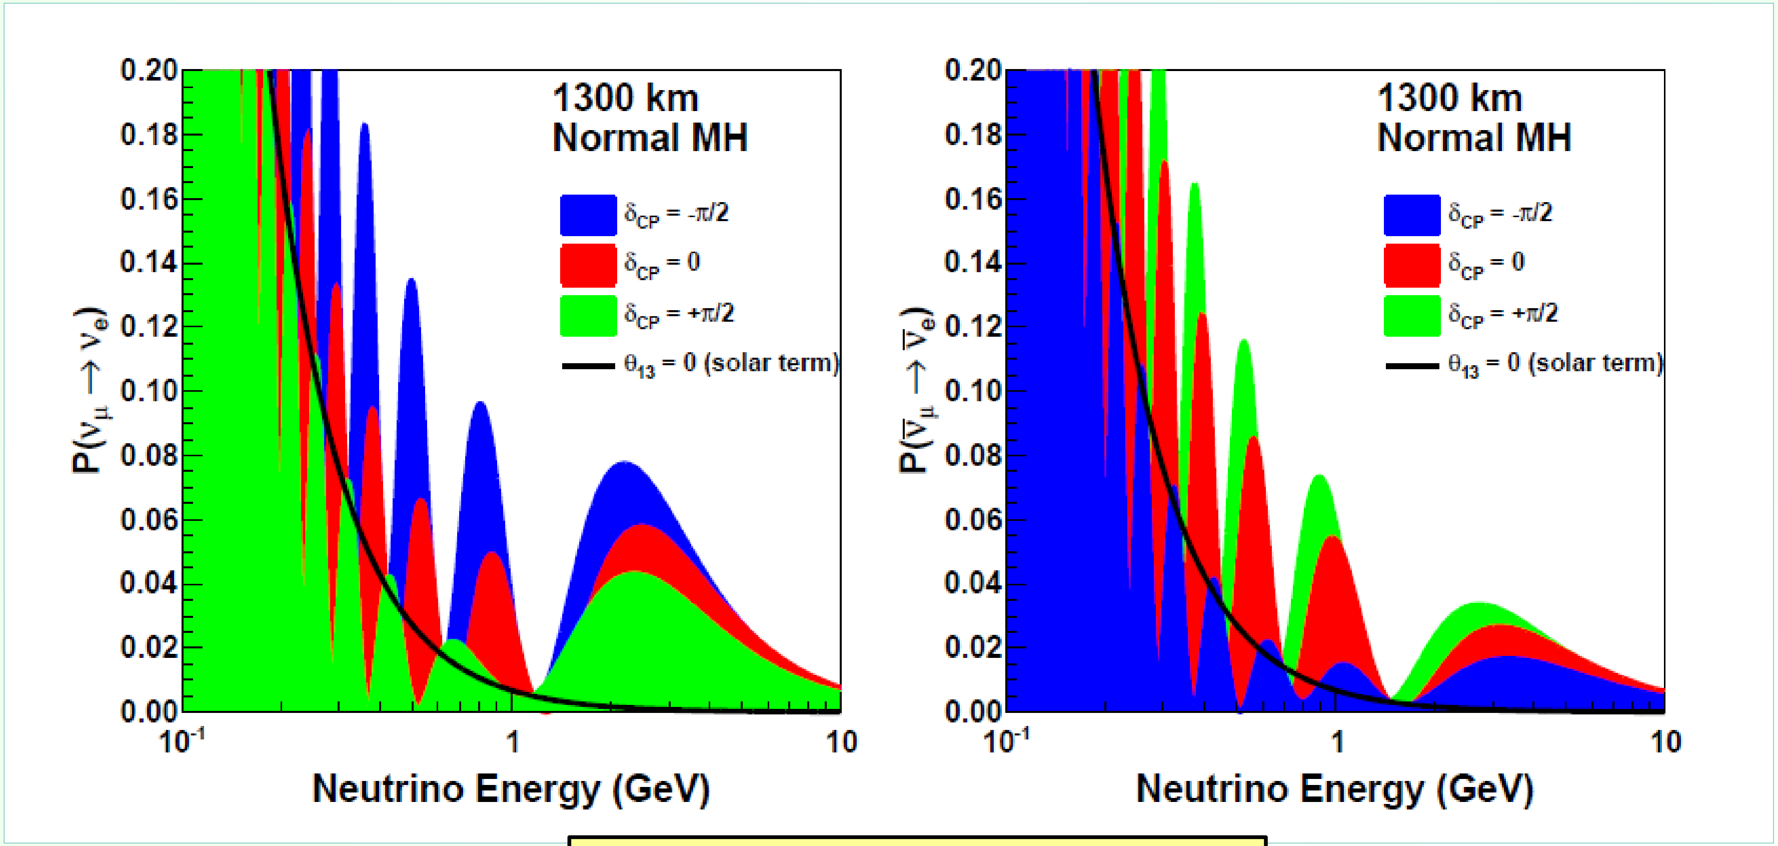
Expected sensitivity of DUNE to CP violation as a function of exposure for a ν_e signal normalization uncertainties between 5% + 1% and 5% + 3%.



Acciari *et al.*, arXiv:1512.06148

Physics motivation

Appearance probability as a function of neutrino energy



Acciari *et al.*, arXiv:1512.06148

Relevance for DUNE

- Neutrino oscillations
  Reduction of systematic uncertainties from nuclear effects, especially for the 2nd oscillation maximum.

- Proton decay
  Probed lifetime affected by the partial depletion of the shell-model states.

- Supernova neutrinos
  Information on the valence shells essential for accurate simulations and detector design.

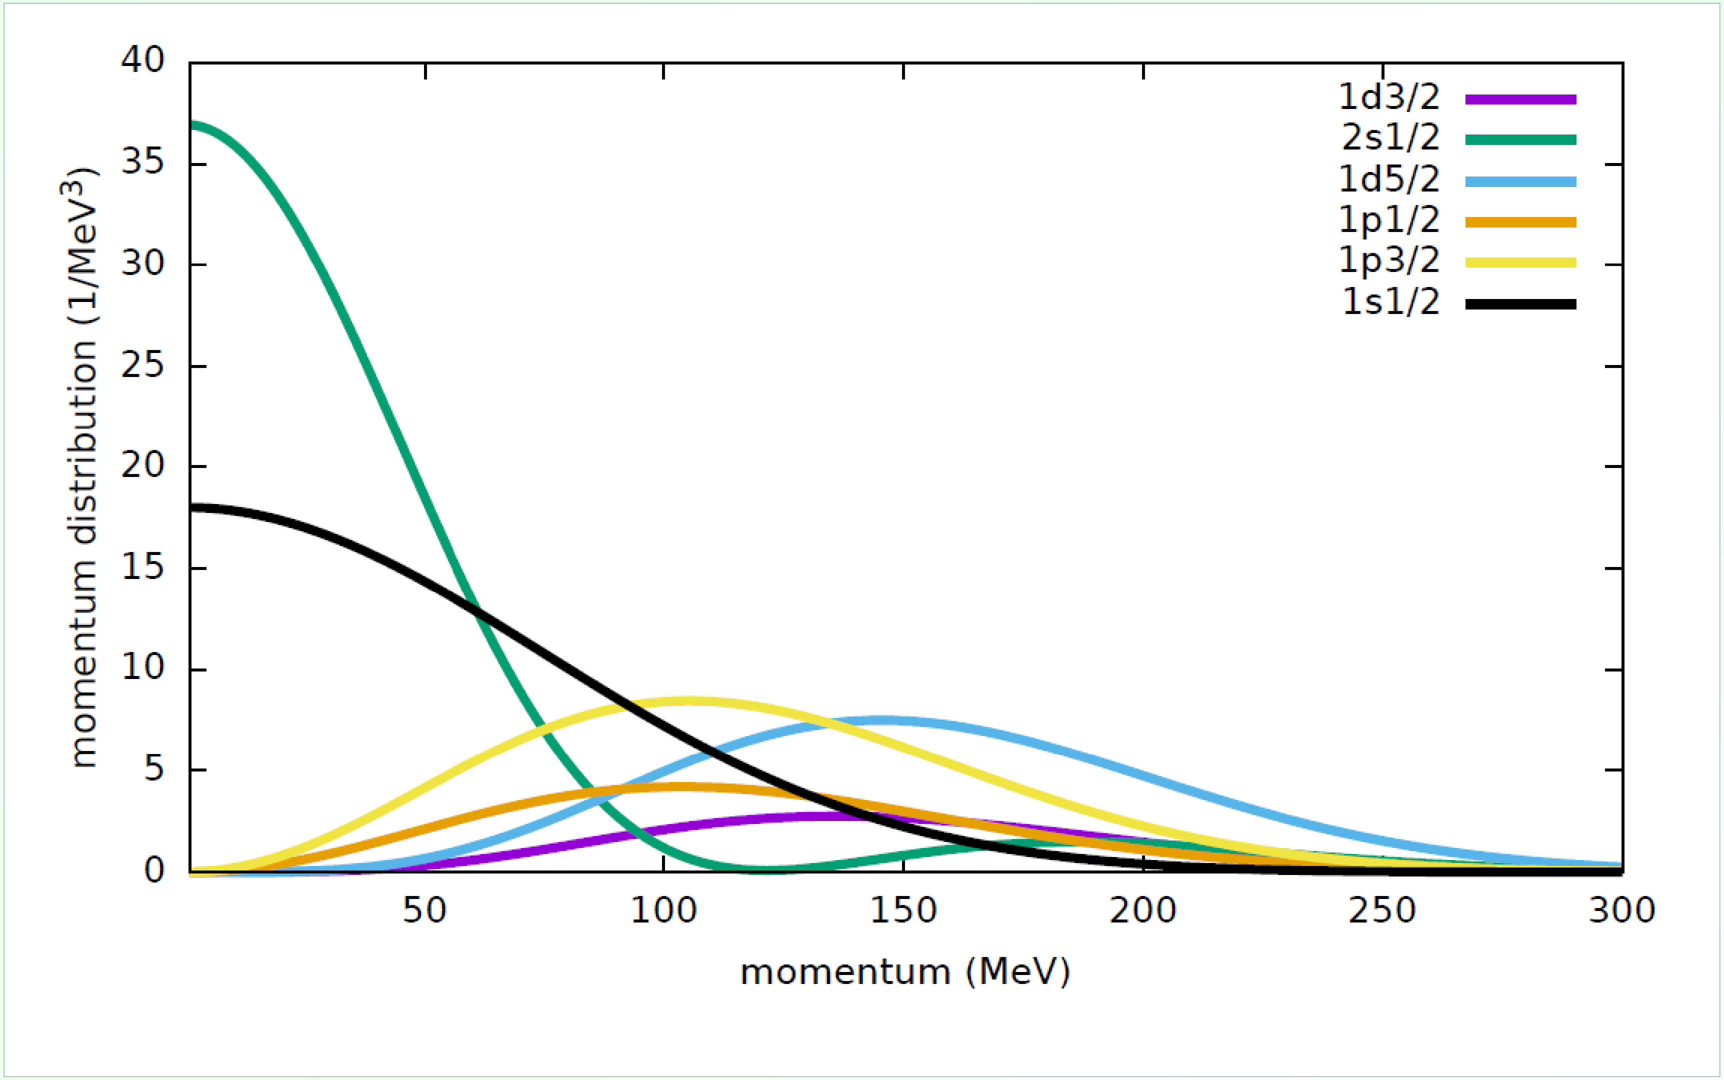
Momentum distributions



Summary

- An accurate description of nuclear effects, including final-state interactions, is crucial for an **accurate reconstruction of neutrino energy**.
- Theoretical models **must be validated** against (*e,e'*) data to estimate their uncertainties.
- The spectral function formalism can be used in Monte Carlo simulations to **improve the accuracy** of description of nuclear effects.
- **JLab experiment** will provide an input to estimate the spectral function of argon, essential for the next generation of neutrino-oscillation experiments.

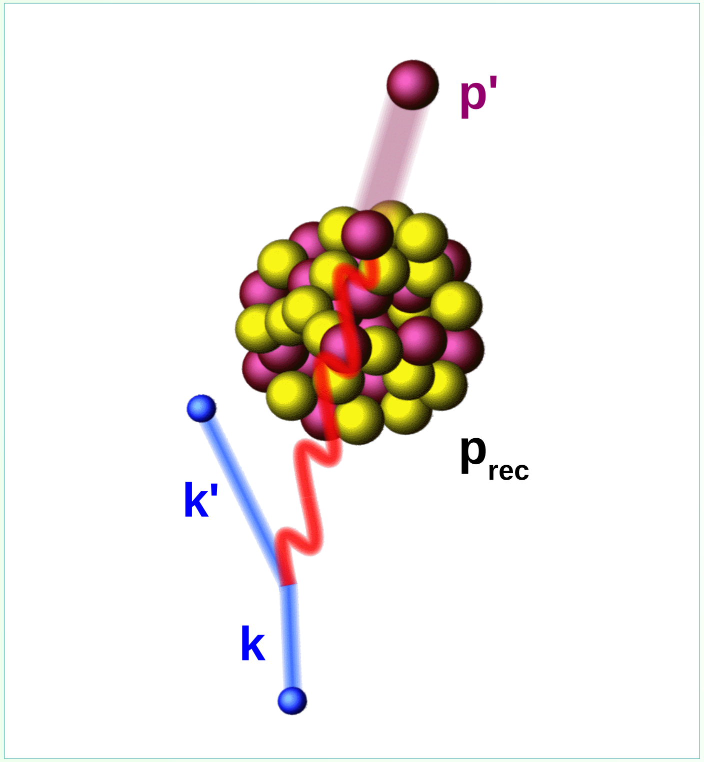
Coincidence electron scattering



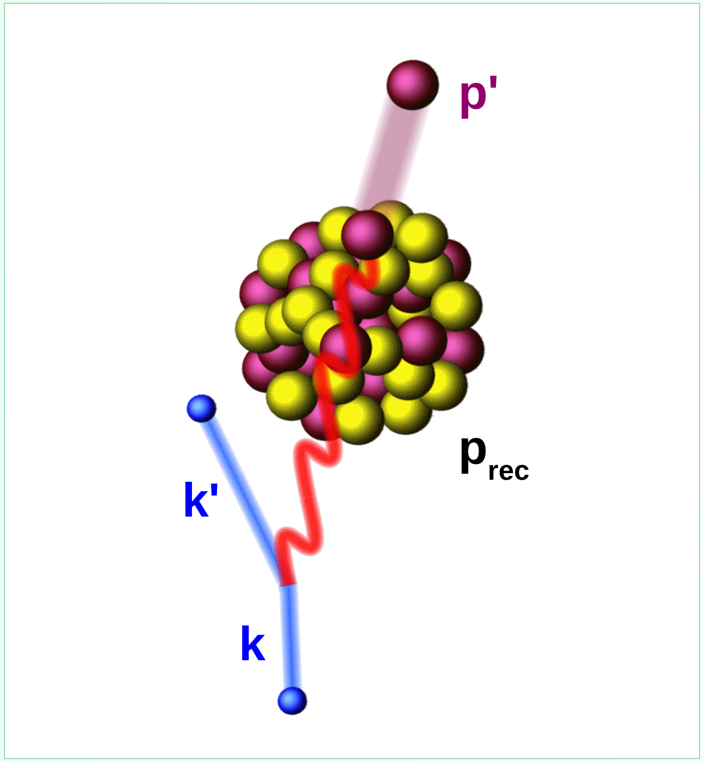
Energy conservation

$$E_{\mathbf{k}} + M_A = E_{\mathbf{k}'} + E_{\mathbf{p}'} + \sqrt{(M_A - M + E)^2 + \mathbf{p}_{\text{rec}}^2}$$

Momentum conservation

$$\mathbf{k} = \mathbf{k}' + \mathbf{p}' + \mathbf{p}_{\text{rec}}$$

(Anti)parallel kinematics, p' ‖ q



Energy conservation

$$E_{\mathbf{k}} + M_A = E_{\mathbf{k}'} + E_{\mathbf{p}'} + \sqrt{(M_A - M + E)^2 + \mathbf{p}_{\rm rec}^2}$$

Momentum conservation

$$\mathrm{q} = \mathrm{p}' + \mathrm{p}_{\rm rec} \rightarrow |\mathrm{q}| = |\mathrm{p}'| + |\mathrm{p}_{\rm rec}|$$

$$\mathrm{q} = \mathrm{p}' + \mathrm{p}_{\rm rec} \rightarrow |\mathrm{q}| = |\mathrm{p}'| - |\mathrm{p}_{\rm rec}|$$
